OpenVMS RTL General Purpose (OTS$) Manual

OpenVMS

Part Number: AA–PV6HA–TK

OpenVMS RTL General Purpose (OTS$) Manual

Order Number: AA–PV6HA–TK

May 1993

This manual documents the general purpose routines contained in the OTS$ facility of the OpenVMS Run-Time Library.

Revision/Update Information: This manual supersedes the *VMS RTL General Purpose (OTS$) Manual*, Version 5.2.

Software Version: OpenVMS AXP Version 1.5
OpenVMS VAX Version 6.0

Digital Equipment Corporation
Maynard, Massachusetts

Preface

This manual provides users of the OpenVMS operating system with detailed usage and reference information on general purpose routines supplied in the OTS$ facility of the Run-Time Library.

Intended Audience

This manual is intended for system and application programmers who want to call Run-Time Library routines.

Document Structure

This manual is organized into two parts as follows:

- Part I contains a brief overview of the OTS$ routines in Chapter 1.
- Part II, the OTS$ Reference Section, provides detailed reference information on each routine contained in the OTS$ facility of the Run-Time Library. This information is presented using the documentation format described in *OpenVMS Programming Interfaces: Calling a System Routine*. Routine descriptions appear in alphabetical order by routine name.

Associated Documents

The Run-Time Library routines are documented in a series of reference manuals. A description of how the Run-Time Library routines are accessed is presented in *OpenVMS Programming Interfaces: Calling a System Routine*. A description of VMS features and functionality available through calls to the OTS$ Run-Time Library appears in the *OpenVMS Programming Concepts Manual*. Descriptions of other RTL facilities and their corresponding routines and usages are discussed in the following books:

- *DPML, Digital Portable Mathematics Library*
- *OpenVMS RTL DECtalk (DTK$) Manual*
- *OpenVMS RTL Library (LIB$) Manual*
- *OpenVMS VAX RTL Mathematics (MTH$) Manual*
- *OpenVMS RTL Parallel Processing (PPL$) Manual*
- *OpenVMS RTL Screen Management (SMG$) Manual*
- *OpenVMS RTL String Manipulation (STR$) Manual*

The *Guide to DECthreads* contains guidelines and reference information for DECthreads, the Digital Multithreading Run-Time Library.

Application programmers using any programming language can refer to the *Guide to Creating OpenVMS Modular Procedures* for writing modular and reentrant code.

High-level language programmers will find additional information on calling Run-Time Library routines in their language reference manual. Additional information may also be found in the language user's guide provided with your VMS language software.

For a complete list and description of the manuals in the VMS documentation set, see the *Overview of OpenVMS Documentation*.

Conventions

In this manual, every use of OpenVMS AXP means the OpenVMS AXP operating system, every use of OpenVMS VAX means the OpenVMS VAX operating system, and every use of OpenVMS means both the OpenVMS AXP operating system and the OpenVMS VAX operating system.

The following conventions are used to identify information specific to OpenVMS AXP or to OpenVMS VAX:

	The AXP icon denotes the beginning of information specific to OpenVMS AXP.
	The VAX icon denotes the beginning of information specific to OpenVMS VAX.
♦	The diamond symbol denotes the end of a section of information specific to OpenVMS AXP or to OpenVMS VAX.

The following conventions are used in this manual:

Ctrl/*x*	A sequence such as Ctrl/*x* indicates down the key labeled Ctrl while you press another key or a pointing device button.
PF1 *x*	A sequence such as PF1 *x* indicates that you must first press and release the key labeled PF1, then press and release another key or a pointing device button.
GOLD *x*	A sequence such as GOLD *x* indicates that you must first press and release the key defined GOLD, then press and release another key. GOLD key sequences can also have a slash (/), dash (-), or underscore (_) as a delimiter in EVE commands.
Return	In examples, a key name enclosed in a box indicates that you press a key on the keyboard. (In text, a key name is not enclosed in a box.)
. . .	A horizontal ellipsis in examples indicates one of the following possibilities: • Additional optional arguments in a statement have been omitted. • The preceding item or items can be repeated one or more times. • Additional parameters, values, or other information can be entered.
. . .	A vertical ellipsis indicates the omission of items from a code example or command format; the items are omitted because they are not important to the topic being discussed.

( )	In format descriptions, parentheses indicate that, if you choose more than one option, you must enclose the choices in parentheses.
[ ]	In format descriptions, brackets indicate optional elements. You can choose one, none, or all of the options. (Brackets are not optional, however, in the syntax of a directory name in an OpenVMS file specification, or in the syntax of a substring specification in an assignment statement.)
{ }	In format descriptions, braces surround a required choice of options; you must choose one of the options listed.
boldface text	Boldface text represents the introduction of a new term or the name of an argument, an attribute, or a reason. Boldface text is also used to show user input in Bookreader versions of the manual.
italic text	Italic text emphasizes important information, indicates variables, and indicates complete titles of manuals. Italic text also represents information that can vary in system messages (for example, Internal error *number*), command lines (for example, /PRODUCER=*name*), and command parameters in text.
UPPERCASE TEXT	Uppercase text indicates a command, the name of a routine, the name of a file, the name of a file protection code, or the abbreviation for a system privilege.
-	A hyphen in code examples indicates that additional arguments to the request are provided on the line that follows.
numbers	All numbers in text are assumed to be decimal, unless otherwise noted. Nondecimal radixes—binary, oc hexadecimal—are explicitly indicated.

Other conventions used in the documentation of Run-Time Library routines are described in *OpenVMS Programming Interfaces: Calling a System Routine*.

1

Overview of the OTS$ Facility

This manual discusses the Run-Time Library OTS$ routines that perform general purpose functions. These functions include data type conversions as part of a compiler's generated code, and some mathematical functions.

Most of the OTS$ routines were originally designed to support language compilers. Because they provide useful functions, they were moved into the language-independent facility, OTS$.

The OTS$ facility provides you with routines that perform seven main tasks:

- Convert data types
- Divide complex and packed decimal values
- Move data to a specified destination address
- Multiply complex values
- Raise a base to an exponent
- Copy a source string to a destination string
- Return a string area to free storage

Table 1–1, Table 1–2, Table 1–3, Table 1–4, Table 1–5, Table 1–6, and Table 1–7 contain all of the OTS$ routines grouped according to their functions.

Table 1–1 OTS$ Conversion Routines

Conversion Routine	Function
OTS$CNVOUT	Convert a D-floating, G-floating, or H-floating value to a character string
OTS$CVT_L_TB	Convert an unsigned integer to binary text
OTS$CVT_L_TI	Convert a signed integer to signed integer text
OTS$CVT_L_TL	Convert an integer to logical text
OTS$CVT_L_TO	Convert an unsigned integer to octal text
OTS$CVT_L_TU	Convert an unsigned integer to decimal text
OTS$CVT_L_TZ	Convert an integer to hexadecimal text
OTS$CVT_TB_L	Convert binary text to an unsigned integer value
OTS$CVT_TI_L	Convert signed integer text to an integer value
OTS$CVT_TL_L	Convert logical text to an integer value
OTS$CVT_TO_L	Convert octal text to an integer value

(continued on next page)

Table 1–1 (Cont.) OTS$ Conversion Routines

Conversion Routine	Function
OTS$CVT_TU_L	Convert unsigned decimal text to an integer value
OTS$CVT_T_z	Convert numeric text to a D- or F-floating value
OTS$CVT_T_x	Convert numeric text to a G- or H-floating value
OTS$CVT_TZ_L	Convert hexadecimal text to an unsigned longword integer value

For more information on Run-Time Library conversion routines, see the CVT$ reference section in the *OpenVMS RTL Library (LIB$) Manual*.

Table 1–2 OTS$ Division Routines

Division Routine	Function
OTS$DIVCx	Perform complex division
OTS$DIV_PK_LONG	Perform packed decimal division with a long divisor
OTS$DIV_PK_SHORT	Perform packed decimal division with a short divisor

Table 1–3 OTS$ Move Data Routines

Move Data Routine	Function
OTS$MOVE3	Move data without fill
OTS$MOVE5	Move data with fill

Table 1–4 OTS$ Multiplication Routine

Multiplication Routine	Function
OTS$MULCx	Perform complex multiplication

Table 1–5 OTS$ Exponentiation Routines

Exponentiation Routine	Function
OTS$POWCxCx	Raise a complex base to a complex floating-point exponent
OTS$POWCxJ	Raise a complex base to a signed longword exponent
OTS$POWDD	Raise a D-floating base to a D-floating exponent
OTS$POWDR	Raise a D-floating base to an F-floating exponent
OTS$POWDJ	Raise a D-floating base to a longword integer exponent

(continued on next page)

Table 1–5 (Cont.) OTS$ Exponentiation Routines

Exponentiation Routine	Function
OTS$POWGx	Raise a G-floating base to a G-floating or longword integer exponent
OTS$POWGJ	Raise a G-floating base to a longword integer exponent
†OTS$POWHx	Raise an H-floating base to a floating-point exponent
OTS$POWHJ	Raise an H-floating base to a longword integer exponent
OTS$POWII	Raise a word integer base to a word integer exponent
OTS$POWHJJ	Raise a longword integer base to a longword integer exponent
OTS$POWLULU	Raise an unsigned longword integer base to an unsigned longword integer exponent
OTS$POWxLU	Raise a floating-point base to an unsigned longword integer exponent
OTS$POWRD	Raise an F-floating base to a D-floating exponent
OTS$POWRJ	Raise an F-floating base to a longword integer exponent
OTS$POWRR	Raise an F-floating base to an F-floating exponent

†VAX VMS specific.

Table 1–6 OTS$ Copy Source String Routines

Copy Source String Routine	Function
OTS$SCOPY_DXDX	Copy a source string passed by descriptor to a destination string
OTS$SCOPY_R_DX	Copy a source string passed by reference to a destination string

Table 1–7 OTS$ Return String Area Routines

Return String Area Routine	Function
OTS$SFREE1_DD	Free one dynamic string
OTS$SFREEN_DD	Free *n* dynamic strings
OTS$SGET1_DD	Get one dynamic string

OTS$ Reference Section

This section provides detailed descriptions of the routines provided by the VMS RTL General Purpose (OTS$) Facility.

OTS$CNVOUT—Convert D-Floating, G-Floating or H-Floating Number to Character String

The Convert Floating to Character String routines convert a D-floating, G-floating or H-floating number to a character string in the FORTRAN E format.

Format

OTS$CNVOUT D-G-or-H-float-pt-input-val ,fixed-length-resultant-string ,digits-in-fraction

OTS$CNVOUT_G D-G-or-H-float-pt-input-val ,fixed-length-resultant-string ,digits-in-fraction

VAX

OTS$CNVOUT_H D-G-or-H-float-pt-input-val ,fixed-length-resultant-string ,digits-in-fraction ♦

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

D-G-or-H-float-pt-input-val

OpenVMS usage	floating_point
type	D_floating, G_floating, H_floating
access	read only
mechanism	by reference

Value that OTS$CNVOUT converts to a character string. For OTS$CNVOUT, the **D-G-or-H-float-pt-input-val** argument is the address of a D-floating number containing the value. For OTS$CNVOUT_G, the **D-G-or-H-float-pt-input-val** argument is the address of a G-floating number containing the value. For OTS$CNVOUT_H, the **D-G-or-H-float-pt-input-val** argument is the address of an H-floating number containing the value.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed length

Output string into which OTS$CNVOUT writes the character string result of the conversion. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to the output string.

digits-in-fraction

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Number of digits in the fractional portion of the result. The **digits-in-fraction** argument is an unsigned longword containing the number of digits to be written to the fractional portion of the result.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
SS$_ROPRAND	Floating reserved operand detected.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is filled with asterisks.

OTS$CVT_L_TB—Convert an Unsigned Integer to Binary Text

The Convert an Unsigned Integer to Binary Text routine converts an unsigned integer value of arbitrary length to binary representation in an ASCII text string. By default, a longword is converted.

Format

OTS$CVT_L_TB varying-input-value ,fixed-length-resultant-string [,number-of-digits] [,input-value-size]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

varying-input-value

OpenVMS usage	varying_arg
type	unspecified
access	read only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_L_TB converts to an unsigned decimal representation in an ASCII text string. (The value of the **input-value-size** argument determines whether **varying-input-value** is a byte, word, or longword.) The **varying-input-value** argument is the address of the unsigned integer.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed-length

ASCII text string that OTS$CVT_L_TB creates when it converts the integer value. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to this ASCII text string. The string is assumed to be of fixed length (DSC$K_CLASS_S).

number-of-digits

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Minimum number of digits in the binary representation to be generated. The **number-of-digits** argument is a signed longword containing this minimum number. If the minimum number of digits is omitted, the default is 1. If the actual number of significant digits is less than the minimum number of digits, leading zeros are produced. If the minimum number of digits is zero and the value of the integer to be converted is also zero, OTS$CVT_L_TB creates a blank string.

input-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Size of the integer to be converted, in bytes. The **input-value-size** argument is a signed longword containing the byte size. This is an optional argument. If the size is omitted, the default is 4 (longword).

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is filled with asterisks.

Example

```
    0    |    1    |    2    |    3    |    4    |    5    |    6    |    7    |
12345678901234567890123456789012345678901234567890123456789012345678901234567890

     FTTY     D   F       4            TTY
     C* Initialize numeric value to be converted.
     C                    Z-ADD13        VALUE   90
     C           CVTLTB   EXTRN'OTS$CVT_L_TB'
     C* Convert the number to binary in a string.
     C                    CALL CVTLTB
     C                    PARM           VALUE      RL
     C                    PARMD          OUTSTR  4
     C* Display the converted string on the terminal.
     C           OUTSTR   DSPLYTTY
     C                    SETON                     LR
```

This RPG II program displays the string '1101' on the terminal.

OTS$CVT_L_TI—Convert Signed Integer to Decimal Text

The Convert Signed Integer to Decimal Text routine converts a signed integer to a decimal ASCII text string. This routine supports FORTRAN Iw and Iw.m output and BASIC output conversion.

Format

OTS$CVT_L_TI varying-input-value ,fixed-length-resultant-string [,number-of-digits] [,input-value-size] [,flags-value]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

varying-input-value

OpenVMS usage	varying_arg
type	unspecified
access	read only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_L_TI converts to an unsigned decimal representation in an ASCII text string. (The value of the **input-value-size** argument determines whether **varying-input-value** is a byte, word, or longword.) The **varying-input-value** argument is the address of the unsigned integer.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed length

Decimal ASCII text string that OTS$CVT_L_TI creates when it converts the signed integer. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to this text string. The string is assumed to be of fixed length (DSC$K_CLASS_S).

number-of-digits

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Minimum number of digits to be generated when OTS$CVT_L_TI converts the signed integer to a decimal ASCII text string. The **number-of-digits** argument is a signed longword containing this number. If the minimum number of digits is omitted, the default value is 1. If the actual number of significant digits is smaller, OTS$CVT_L_TI inserts leading zeros into the output string. If **number-of-digits** is zero and **varying-input-value** is zero, OTS$CVT_L_TI writes a blank string to the output string.

input-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Size of the integer to be converted, in bytes. The **input-value-size** argument is a signed longword containing this value size. The value size must be either 1, 2, or 4. If value size is 1 or 2, the value is sign-extended to a longword before conversion. If the size is omitted, the default is 4 (longword).

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

Caller-supplied flags that you can use if you want OTS$CVT_L_TI to insert a plus sign before the converted number. The **flags-value** argument is an unsigned longword containing the flags.

The caller flags are defined as follows:

Bit 0 If set, a plus sign (+) is inserted before the first nonblank character in the output string; otherwise, the plus sign is omitted.

If **flags-value** is omitted, all bits are clear and the plus sign is not inserted.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is filled with asterisks.

OTS$CVT_L_TL—Convert Integer to Logical Text

The Convert Integer to Logical Text routine converts an integer to an ASCII text string representation using FORTRAN L (logical) format.

Format

OTS$CVT_L_TL longword-integer-value ,fixed-length-resultant-string

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

longword-integer-value

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by reference

Value that OTS$CVT_L_TL converts to an ASCII text string. The **longword-integer-value** argument is the address of a signed longword containing this integer value.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed length

Output string that OTS$CVT_L_TL creates when it converts the integer value to an ASCII text string. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to this ASCII text string.

The output string is assumed to be of fixed length (DSC$K_CLASS_S).

If *length* equals the fixed length of the output string, then the output string consists of (*length* – 1) blanks followed by the letter T if bit 0 is set, or the letter F if bit 0 is clear.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is of zero length (DSC$W_LENGTH= 0).

Example

```
5 !+
  ! This is an example program
  ! showing the use of OTS$CVT_L_TL.
  !-

  VALUE% = 10
  OUTSTR$ = ' '
  CALL OTS$CVT_L_TL(VALUE%, OUTSTR$)
  PRINT OUTSTR$
9 END
```

This BASIC example illustrates the use of OTS$CVT_L_TL. The output generated by this program is 'F'.

OTS$CVT_L_TO—Convert Unsigned Integer to Octal Text

The Convert Unsigned Integer to Octal Text routine converts an unsigned integer to an octal ASCII text string. OTS$CVT_L_TO supports FORTRAN Ow and Ow.m output conversion formats.

Format

OTS$CVT_L_TO varying-input-value ,fixed-length-resultant-string [,number-of-digits] [,input-value-size]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

varying-input-value

OpenVMS usage	varying_arg
type	unspecified
access	read only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_L_TO converts to an unsigned decimal representation in an ASCII text string. (The value of the **input-value-size** argument determines whether **varying-input-value** is a byte, word, or longword.) The **varying-input-value** argument is the address of the unsigned integer.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed length

Output string that OTS$CVT_L_TO creates when it converts the integer value to an octal ASCII text string. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to the octal ASCII text string. The string is assumed to be of fixed length (DSC$K_CLASS_S).

number-of-digits

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Minimum number of digits that OTS$CVT_L_TO generates when it converts the integer value to an octal ASCII text string. The **number-of-digits** argument is a signed longword containing the minimum number of digits. If it is omitted, the default is 1. If the actual number of significant digits in the octal ASCII text string is less than the minimum number of digits, OTS$CVT_L_TO inserts

leading zeros into the output string. If **number-of-digits** is zero and **varying-input-value** is zero, OTS$CVT_L_TO writes a blank string to the output string.

input-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Size of the integer to be converted, in bytes. The **input-value-size** argument is a signed longword containing the number of bytes in the integer to be converted by OTS$CVT_L_TO. If it is omitted, the default is 4 (longword).

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is filled with asterisks.

OTS$CVT_L_TU—Convert Unsigned Integer to Decimal Text

The Convert Unsigned Integer to Decimal Text routine converts a byte, word, or longword value to unsigned decimal representation in an ASCII text string. By default, a longword is converted.

Format

OTS$CVT_L_TU varying-input-value ,fixed-length-resultant-string [,number-of-digits] [,input-value-size]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

varying-input-value

OpenVMS usage	varying_arg
type	unspecified
access	read only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_L_TU converts to an unsigned decimal representation in an ASCII text string. (The value of the **input-value-size** argument determines whether **varying-input-value** is a byte, word, or longword.) The **varying-input-value** argument is the address of the unsigned integer.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed-length

Output string (fixed-length) that OTS$CVT_L_TU creates when it converts the integer value to unsigned decimal representation in an ASCII text string. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to this ASCII text string.

number-of-digits

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Minimum number of digits in the ASCII text string that OTS$CVT_L_TU creates. The **number-of-digits** argument is a signed longword containing the minimum number. If the minimum number of digits is omitted, the default is 1.

If the actual number of significant digits in the output string created is less than the minimum number, OTS$CVT_L_TU inserts leading zeros into the output string. If the minimum number of digits is zero and the integer value to be converted is also zero, OTS$CVT_L_TU writes a blank string to the output string.

input-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Size of the integer value to be converted, in bytes. The **input-value-size** argument is a signed longword containing the size of the integer value. If the size is omitted, the default is 4. The only values that OTS$CVT_L_TU allows are 1, 2 and 4. If any other value is specified, OTS$CVT_L_TU uses the default value, which is 4 (longword).

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is filled with asterisks.

Example

```
    0    |    1    |    2    |    3    |    4    |    5    |    6    |    7    |
12345678901234567890123456789012345678901234567890123456789012345678901234567890
     FTTY     D   F       7            TTY
     C* Initialize numeric value to be converted.
     C                    Z-ADD32857     VALUE   90
     C                    Z-ADD7         DIGITS  90
     C           CVTLTU   EXTRN'OTS$CVT_L_TU'
     C* Convert the number to decimal in a string with 7 decimal digits.
     C                    CALL CVTLTU
     C                    PARM           VALUE      RL
     C                    PARMD          OUTSTR  7
     C                    PARMV          DIGITS
     C* Display the converted string on the terminal.
     C           OUTSTR   DSPLYTTY
     C                    SETON                     LR
```

This RPG II program displays the string '0032857' on the terminal screen.

OTS$CVT_L_TZ—Convert Integer to Hexadecimal Text

The Convert Integer to Hexadecimal Text routine converts an unsigned integer to a hexadecimal ASCII text string. OTS$CVT_L_TZ supports FORTRAN Zw and Zw.m output conversion formats.

Format

OTS$CVT_L_TZ varying-input-value ,fixed-length-resultant-string [,number-of-digits] [,input-value-size]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

varying-input-value

OpenVMS usage	varying_arg
type	unspecified
access	read only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_L_TZ converts to an unsigned decimal representation in an ASCII text string. (The value of the **input-value-size** argument determines whether **varying-input-value** is a byte, word, or longword.) The **varying-input-value** argument is the address of the unsigned integer.

fixed-length-resultant-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor, fixed length

Output string that OTS$CVT_L_TZ creates when it converts the integer value to a hexadecimal ASCII text string. The **fixed-length-resultant-string** argument is the address of a descriptor pointing to this ASCII text string. The string is assumed to be of fixed length (DSC$K_CLASS_S).

number-of-digits

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Minimum number of digits in the ASCII text string that OTS$CVT_L_TZ creates when it converts the integer. The **number-of-digits** argument is a signed longword containing this minimum number. If it is omitted, the default is 1. If the actual number of significant digits in the text string that OTS$CVT_L_TZ creates is less than this minimum number, OTS$CVT_L_TZ inserts leading zeros in the output string. If the minimum number of digits is zero and the integer

value to be converted is also zero, OTS$CVT_L_TZ writes a blank string to the output string.

input-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Size of the integer that OTS$CVT_L_TZ converts, in bytes. The **input-value-size** argument is a signed longword containing the value size. If the size is omitted, the default is 4 (longword).

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_OUTCONERR	Output conversion error. The result would have exceeded the fixed-length string; the output string is filled with asterisks.

Example

```
with TEXT_IO; use TEXT_IO;
procedure SHOW_CONVERT is

   type INPUT_INT is new INTEGER range 0..INTEGER'LAST;

   INTVALUE : INPUT_INT := 256;
   HEXSTRING : STRING(1..11);

   procedure CONVERT_TO_HEX (I : in INPUT_INT; HS : out STRING);
   pragma INTERFACE (RTL, CONVERT_TO_HEX);
   pragma IMPORT_routine (INTERNAL => CONVERT_TO_HEX,
                          EXTERNAL => "OTS$CVT_L_TZ",
                          MECHANISM =>(REFERENCE,
                                       DESCRIPTOR (CLASS => S)));

begin
   CONVERT_TO_HEX (INTVALUE, HEXSTRING);
   PUT_LINE("This is the value of HEXSTRING");
   PUT_LINE(HEXSTRING);
end;
```

This VAX Ada example uses OTS$CVT_L_TZ to convert a longword integer to hexadecimal text.

OTS$CVT_TB_L—Convert Binary Text to Unsigned Integer

The Convert Binary Text to Unsigned Integer routine converts an ASCII text string representation of an unsigned binary value to an unsigned integer value of arbitrary length. By default, the result is a longword. Valid input characters are the blank and the digits 0 and 1. No sign is permitted.

Format

OTS$CVT_TB_L input-string ,varying-output-value [,output-value-size] [,flags-value]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor

Input string containing the string representation of an unsigned binary value that OTS$CVT_TB_L converts to an integer value. The **input-string** argument is the address of a descriptor pointing to the string.

varying-output-value

OpenVMS usage	varying_arg
type	unspecified
access	write only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_TB_L creates when it converts the ASCII text string. (The value of the **output-value-size** argument determines whether **varying-output-value** is a byte, word, or longword.) The **varying-output-value** argument is the address of the unsigned integer.

output-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Number of bytes to be occupied by the value created when OTS$CVT_TB_L converts the ASCII text string to an integer value. The **output-value-size** argument contains the value size. If **output-value-size** contains a zero or a negative number, OTS$CVT_TB_L returns an error code as the condition value. Valid values for the **output-value-size** argument are 1, 2, and 4; the contents determine whether the integer value that OTS$CVT_TB_L creates is a byte, word, or longword. If the number of bytes is omitted, the default is 4 (longword).

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags that OTS$CVT_TB_L uses to determine how to interpret blanks and tabs. The **flags-value** argument contains the value of the user-supplied flags.

The flags are defined as follows:

Bit	Description
0	If set, OTS$CVT_TB_L ignores blanks. If clear, OTS$CVT_TB_L interprets blanks as zeros.
4	If set, OTS$CVT_TB_L ignores tabs. If clear, OTS$CVT_TB_L interprets tabs as invalid characters.

The default is that all bits are clear.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error. An invalid character, overflow, or invalid **input-value-size** occurred.

Example

```
OPTION                                  &
    TYPE = EXPLICIT

!+
!   This program demonstrates the use of OTS$CVT_TB_L from BASIC.
!   Several binary numbers are read and then converted to their
!   integer equivalents.
!-

!+
!   DECLARATIONS
!-

DECLARE STRING BIN_STR
DECLARE LONG BIN_VAL, I, RET_STATUS
DECLARE LONG CONSTANT FLAGS = 17        ! 2^0 + 2^4
EXTERNAL LONG FUNCTION OTS$CVT_TB_L (STRING, LONG, &
    LONG BY VALUE, LONG BY VALUE)

!+
!   MAIN PROGRAM
!-

!+
!   Read the data, convert it to binary, and print the result.
!-
```

```
    FOR I = 1 TO 5
        READ BIN_STR
        RET_STATUS = OTS$CVT_TB_L( BIN_STR, BIN_VAL, '4'L, FLAGS)
        PRINT BIN_STR;" treated as a binary number equals";BIN_VAL
    NEXT I

    !+
    !   Done, end the program.
    !-

    GOTO 32767

999 Data    "1111", "1 111", "1011011", "11111111", "00000000"

32767 END
```

This BASIC example program demonstrates how to call OTS$CVT_TB_L to convert binary text to a longword integer.

The output generated by this BASIC program is as follows:

```
1111 treated as a binary number equals 15
1 111 treated as a binary number equals 15
1011011 treated as a binary number equals 91
11111111 treated as a binary number equals 255
00000000 treated as a binary number equals 0
```

OTS$CVT_TI_L—Convert Signed Integer Text to Integer

The Convert Signed Integer Text to Integer routine converts an ASCII text string representation of a decimal number to a signed byte, word, or longword integer value. The result is a longword by default, but the calling program can specify a byte or a word value instead.

Format

OTS$CVT_TI_L fixed-or-dynamic-input-string ,varying-output-value [,output-value-size] [,flags-value]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-or-dynamic-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length or dynamic string

Input ASCII text string that OTS$CVT_TI_L converts to a signed byte, word, or longword. The **fixed-or-dynamic-input-string** argument is the address of a descriptor pointing to the input string.

The syntax of a valid ASCII text input string is as follows:

[+ or –] <integer-digits>

OTS$CVT_TI_L always ignores leading blanks. A decimal point is assumed at the right of the input string.

varying-output-value

OpenVMS usage	varying_arg
type	unspecified
access	write only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_TI_L creates when it converts the ASCII text string. (The value of the **output-value-size** argument determines whether **varying-output-value** is a byte, word, or longword.) The **varying-output-value** argument is the address of the unsigned integer.

output-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Number of bytes to be occupied by the value created when OTS$CVT_TI_L converts the ASCII text string to an integer value. The **output-value-size**

argument contains the number of bytes. If **output-value-size** contains a zero or a negative number, OTS$CVT_TI_L returns an error code as the condition value. Valid values for the **output-value-size** argument are 1, 2, and 4; the contents determine whether the integer value that OTS$CVT_TI_L creates is a byte, word, or longword. If the number of bytes is omitted, the default is 4 (longword).

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags that OTS$CVT_TI_L uses to determine how blanks and tabs are interpreted. The **flags-value** argument is an unsigned longword containing the value of the flags.

Bit	Description
0	If set, OTS$CVT_TI_L ignores all blanks. If clear, OTS$CVT_TI_L ignores leading blanks but interprets blanks after the first legal character as zeros.
4	If set, OTS$CVT_TI_L ignores tabs. If clear, OTS$CVT_TI_L interprets tabs as invalid characters.

If **flags-value** is omitted, the default is that all bits are cleared.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error: an invalid character in the input string; or the value overflows byte, word, or longword; or **output-value-size** is invalid. **Varying-output-value** is set to zero.

OTS$CVT_TL_L—Convert Logical Text to Integer

The Convert Logical Text to Integer routine converts an ASCII text string representation of a FORTRAN–77 L format to a byte, word, or longword integer value. The result is a longword by default, but the calling program can specify a byte or a word value instead.

Format

OTS$CVT_TL_L fixed-or-dynamic-input-string ,varying-output-value [,output-value-size]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-or-dynamic-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length or dynamic string

Input string containing an ASCII text representation of a FORTRAN–77 L format that OTS$CVT_TL_L converts to a byte, word, or longword integer value. The **fixed-or-dynamic-input-string** argument is the address of a descriptor pointing to the input string.

The syntax of a valid ASCII text input string is either: *Blank* (end of string) or *Blank Period Letter Character* (end of string)

The elements in the preceding input string are defined as follows:

Term	Description
Blank	Zero or more blanks
Period	. or nothing
Letter	T, t, F, or f
Character	Zero or more of any character

varying-output-value

OpenVMS usage	varying_arg
type	unspecified
access	write only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_TL_L creates when it converts the ASCII text string. (The value of the **output-value-size** argument determines whether **varying-output-value** is a byte, word, or longword.) The **varying-output-value** argument is the address of the unsigned integer.

OTS$CVT_TL_L returns –1 as the contents of the **varying-output-value** argument if the character denoted by "Letter" is "T" or "t". Otherwise, OTS$CVT_TL_L sets **varying-output-value** to zero.

output-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Number of bytes to be occupied by the value created when OTS$CVT_TL_L converts the ASCII text string to an integer value. The **output-value-size** argument contains the number of bytes. If **output-value-size** contains a zero or a negative number, OTS$CVT_TL_L returns an error code as the condition value. Valid values for the **output-value-size** argument are 1, 2, and 4; the contents determine whether the integer value that OTS$CVT_TI_L creates is a byte, word, or longword. If it is omitted, the default is 4 (longword).

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Invalid character in the input string or invalid **input-value-size**; **varying-input-value** is set to zero.

OTS$CVT_TO_L—Convert Octal Text to Signed Integer

The Convert Octal Text to Signed Integer routine converts an ASCII text string representation of an octal value to a signed integer of an arbitrary length. The result is a longword by default, but the calling program can specify a byte, word, or longword.

Format

```
OTS$CVT_TO_L  fixed-or-dynamic-input-string ,varying-output-value
              [,output-value-size] [,flags-value]
```

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-or-dynamic-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length or dynamic string

Input string containing an ASCII text string representation of an octal value that OTS$CVT_TO_L converts to a signed integer. The **fixed-or-dynamic-input-string** argument is the address of a descriptor pointing to the input string. The valid input characters are blanks and the digits are 0 through 7. No sign is permitted.

varying-output-value

OpenVMS usage	varying_arg
type	unspecified
access	write only
mechanism	by reference

Signed byte, word, or longword that OTS$CVT_TO_L creates when it converts the ASCII text string. (The value of the **output-value-size** argument determines whether **varying-output-value** is a byte, word, or longword.) The **varying-output-value** argument is the address of the signed integer.

output-value-size

OpenVMS usage	longword_signed
type	longword integer (signed)
access	read only
mechanism	by value

Number of bytes occupied by the signed integer value. The **output-value-size** argument contains the number of bytes. If the content of the **output-value-size** argument is zero or a negative number, OTS$CVT_TO_L returns an error. If the number of bytes is omitted, the default is 4 (longword).

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags that OTS$CVT_TO_L uses to determine how blanks within the input string are interpreted. The **flags-value** argument contains the user-supplied flags.

Bit 0 If set, OTS$CVT_TO_L ignores all blanks. If clear, OTS$CVT_TO_L interprets blanks as zeros.

If **flags-value** is omitted, the default is that all bits are clear.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error. An invalid character, overflow, or invalid **input-value-size** occurred.

Example

```
OCTAL_CONV: PROCEDURE OPTIONS (MAIN) RETURNS (FIXED BINARY (31));

%INCLUDE $STSDEF;       /* Include definition of return status values      */
DECLARE OTS$CVT_TO_L ENTRY
        (CHARACTER (*),         /* Input string passed by descriptor       */
        FIXED BINARY (31),      /* Returned value passed by reference      */
        FIXED BINARY VALUE,     /* Size for returned value passed by value */
        FIXED BINARY VALUE)     /* Flags passed by value                   */
        RETURNS (FIXED BINARY (31))     /* Return status                   */
        OPTIONS (VARIABLE);     /* Arguments may be omitted                */

DECLARE INPUT CHARACTER (10);
DECLARE VALUE FIXED BINARY (31);
DECLARE SIZE  FIXED BINARY(31) INITIAL(4) READONLY STATIC; /* Longword     */
DECLARE FLAGS FIXED BINARY(31) INITIAL(1) READONLY STATIC; /* Ignore blanks */

ON ENDFILE (SYSIN) STOP;

DO WHILE ('1'B);                /* Loop continuously, until end of file    */
        PUT SKIP (2);
        GET LIST (INPUT) OPTIONS (PROMPT ('Octal value: '));
        STS$VALUE = OTS$CVT_TO_L (INPUT, VALUE, SIZE, FLAGS);
        IF ^STS$SUCCESS THEN RETURN (STS$VALUE);
        PUT SKIP EDIT (INPUT, 'Octal equals', VALUE, 'Decimal')
                        (A,X,A,X,F(10),X,A);
        END;

END OCTAL_CONV;
```

This PL/I program translates an octal value in ASCII into a fixed binary value. The program is run interactively; simply press Ctrl/Z to quit.

```
$ RUN OCTAL
Octal value: 1
1  Octal equals 1 Decimal
Octal value: 11
11   Octal equals   9 Decimal
Octal value: 1017346
1017346 Octal equals 274150 Decimal
Octal value: Ctrl/Z
```

OTS$CVT_TU_L—Convert Unsigned Decimal Text to Integer

The Convert Unsigned Decimal Text to Integer routine converts an ASCII text string representation of an unsigned decimal value to an unsigned byte, word, or longword value. By default, the result is a longword. Valid input characters are the space and the digits 0 through 9. No sign is permitted.

Format

OTS$CVT_TU_L fixed-length-input-string ,varying-output-value [,output-value-size] [,flags-value]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-length-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length

Input string (fixed-length) containing an ASCII text string representation of an unsigned decimal value that OTS$CVT_TU_L converts to a byte, word, or longword value. The **fixed-length-input-string** argument is the address of a descriptor pointing to the input string.

varying-output-value

OpenVMS usage	varying_arg
type	unspecified
access	write only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_TU_L creates when it converts the ASCII text string. (The value of the **output-value-size** argument determines whether **varying-output-value** is a byte, word, or longword.) The **varying-output-value** argument is the address of the unsigned integer.

output-value-size

OpenVMS usage	longword_signed
type	longword integer (signed)
access	read only
mechanism	by value

Number of bytes occupied by the value created when OTS$CVT_TU_L converts the input string. The **output-value-size** argument contains the number of bytes. OTS$CVT_TU_L allows value sizes of 1, 2 and 4. If any other value is specified, or if **output-value-size** is omitted, OTS$CVT_TU_L uses the default, which is 4.

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags that OTS$CVT_TU_L uses to determine how blanks and tabs are interpreted. The **flags-value** argument contains the user-supplied flags.

Bit	Description
0	If set, OTS$CVT_TU_L ignores blanks. If clear, OTS$CVT_TU_L interprets blanks as zeros.
4	If set, OTS$CVT_TU_L ignores tabs. If clear, OTS$CVT_TU_L interprets tabs as invalid characters.

If it is omitted, the default is that all bits are clear.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error. An invalid character, overflow or invalid **input-value-size** occurred.

OTS$CVT_T_z—Convert Numeric Text to D- or F-Floating Value

The Convert Numeric Text to D- or F-Floating routines convert an ASCII text string representation of a numeric value to a D-floating or F-floating value.

Format

OTS$CVT_T_D fixed-or-dynamic-input-string ,floating-point-value [,digits-in-fraction] [,scale-factor] [,flags-value] [,extension-bits]

OTS$CVT_T_F fixed-or-dynamic-input-string ,floating-point-value [,digits-in-fraction] [,scale-factor] [,flags-value] [,extension-bits]

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-or-dynamic-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length or dynamic string

Input string containing an ASCII text string representation of a numeric value that OTS$CVT_T_z converts to a D-floating or F-floating value. The **fixed-or-dynamic-input-string** argument is the address of a descriptor pointing to the input string.

The syntax of a valid input string is as follows:

Blank Sign Digit Period Digit$^{letter\ blank\ sign\ OR\ sign\ digit}$

The elements in the preceding input string are defined as follows:

Term	Description
Blank	Zero or more blanks
Sign	+, –, or nothing
Digit	Zero or more decimal digits
Period	. or nothing
Letter	E, e, D, d, Q, or q

There is no difference in semantics among any of the six valid exponent letters (E, e, D, d, Q, q).

floating-point-value

OpenVMS usage	floating_point
type	D_floating, F_floating
access	write only
mechanism	by reference

Floating-point value that OTS$CVT_T_z creates when it converts the input string. The **floating-point-value** argument is the address of the floating-point value. For OTS$CVT_T_D, **floating-point-value** is a D-floating number. For OTS$CVT_T_F, **floating-point-value** is an F-floating number.

digits-in-fraction

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Number of digits in the fraction if no decimal point is included in the input string. The **digits-in-fraction** argument contains the number of digits. If the number of digits is omitted, the default is zero.

scale-factor

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Scale factor. The **scale-factor** argument contains the value of the scale factor. If bit 6 of the **flags-value** argument is clear, the resultant value is divided by $10^{scale-factor}$ unless the exponent is present. If bit 6 of **flags-value** is set, the scale factor is always applied. If the scale factor is omitted, the default is zero.

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags. The **flags-value** argument contains the user-supplied flags.

Bit 0	If set, OTS$CVT_T_z ignores blanks. If clear, OTS$CVT_T_z interprets blanks as zeros.
Bit 1	If set, OTS$CVT_T_z allows only E or e exponents. If clear, OTS$CVT_T_z allows E, e, D, d, Q and q exponents. (Bit 1 is clear for BASIC and set for FORTRAN.)
Bit 2	If set, OTS$CVT_T_z interprets an underflow as an error. If clear, OTS$CVT_T_z does not interpret an underflow as an error.
Bit 3	If set, OTS$CVT_T_z truncates the value. If clear, OTS$CVT_T-z rounds the value.
Bit 4	If set, OTS$CVT_T_z ignores tabs. If clear, OTS$CVT_T_z interprets tabs as invalid characters.
Bit 5	If set, an exponent must begin with a valid exponent letter. If clear, the exponent letter can be omitted.
Bit 6	If set, OTS$CVT_T_z always applies the scale factor. If clear, OTS$CVT_T_z applies the scale factor only if there is no exponent present in the string.

If **flags-value** is omitted, all bits are clear.

extension-bits

OpenVMS usage	word_signed
type	word (signed)
access	write only
mechanism	by reference

Extra precision bits. The **extension-bits** argument is the address of a word containing the extra precision bits. If **extension-bits** is present, **floating-point-value** is not rounded, and the first *n* bits after truncation are returned in this argument.

These values are suitable for use as the extension operand in an EMOD instruction.

Description

These routines support FORTRAN D, E, F, and G input type conversion as well as similar types for other languages.

OTS$CVT_T_D and OTS$CVT_T_F provide run-time support for BASIC and FORTRAN input statements.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error; an invalid character in the input string, or the value is outside the range that can be represented. **Floating-point-value** is set to +0.0 (not reserved operand –0.0).

Example

```
C+
C This is a FORTRAN program demonstrating the use of
C OTS$CVT_T_F.
C-

        REAL*4 A
        CHARACTER*10 T(5)
        DATA T/'1234567+23','8.786534+3','-983476E-3','-23.734532','45'/
        DO 2 I = 1, 5
        TYPE 1,I,T(I)
 1      FORMAT(' Input string ',I1,' is ',A10)

C+
C B is the return status.
C T(I) is the string to be converted to an
C F-floating point value.  A is the F-floating
C point conversion of T(I).  %VAL(5) means 5 digits
C are in the fraction if no decimal point is in
C the input string T(I).
C-
        B = OTS$CVT_T_F(T(I),A,%VAL(5),,)
        TYPE *,' Output of OTSCVT_T_F is     ',A
        TYPE *,'  '
 2      CONTINUE
        END
```

This FORTRAN example demonstrates the use of OTS$CVT_T_F. The output generated by this program is as follows:

```
Input string 1 is 1234567+23
 Output of OTSCVT_T_F is       1.2345669E+24
Input string 2 is 8.786534+3
 Output of OTSCVT_T_F is        8786.534
Input string 3 is -983476E-3
 Output of OTSCVT_T_F is      -9.8347599E-03
Input string 4 is -23.734532
 Output of OTSCVT_T_F is       -23.73453
Input string 5 is 45
 Output of OTSCVT_T_F is        45000.00
```

OTS$CVT_T_z—Convert Numeric Text to G- or H-Floating Value

The Convert Numeric Text to G- or H-Floating routines convert an ASCII text string representation of a numeric value to a G-floating or H-floating value.

Format

OTS$CVT_T_G fixed-or-dynamic-input-string ,floating-point-value [,digits-in-fraction] [,scale-factor] [,flags-value] [,extension-bits]

VAX

OTS$CVT_T_H fixed-or-dynamic-input-string ,floating-point-value [,digits-in-fraction] [,scale-factor] [,flags-value] [,extension-bits] ♦

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-or-dynamic-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length or dynamic string

Input string containing an ASCII text string representation of a numeric value that OTS$CVT_T_z converts to a G-floating or H-floating value. The **fixed-or-dynamic-input-string** argument is the address of a descriptor pointing to the input string.

The syntax of a valid input string is as follows:

Blank Sign Digit Period Digit$^{letter\ blank\ sign\ OR\ sign\ digit}$

The elements in the preceding input string are defined as follows:

Term	Description
Blank	Zero or more blanks
Sign	+, –, or nothing
Digit	Zero or more decimal digits
Period	. or nothing
Letter	E, e, D, d, Q, or q

There is no difference in semantics among any of the six valid exponent letters (E, e, D, d, Q, q).

floating-point-value

OpenVMS usage	floating_point
type	G_floating, H_floating
access	write only
mechanism	by reference

Floating-point value that OTS$CVT_T_z creates when it converts the input string. The **floating-point-value** argument is the address of the floating-point value. For OTS$CVT_T_G, **floating-point-value** is a G-floating number. For OTS$CVT_T_H, **floating-point-value** is an H-floating number.

digits-in-fraction

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Number of digits in the fraction if no decimal point is included in the input string. The **digits-in-fraction** argument contains the number of digits. If the number of digits is omitted, the default is zero.

scale-factor

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Scale factor. The **scale-factor** argument contains the value of the scale factor. If bit 6 of the **flags-value** argument is clear, the resultant value is divided by $10^{scale-factor}$ unless the exponent is present. If bit 6 of **flags-value** is set, the scale factor is always applied. If the scale factor is omitted, the default is zero.

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags. The **flags-value** argument contains the user-supplied flags.

Bit 0 — If set, OTS$CVT_T_z ignores blanks. If clear, OTS$CVT_T_z interprets blanks as zeros.

Bit 1 — If set, OTS$CVT_T_z allows only E or e exponents. If clear, OTS$CVT_T_z allows E, e, D, d, Q, and q exponents. (Bit 1 is clear for BASIC and set for FORTRAN.)

Bit 2 — If set, OTS$CVT_T_z interprets an underflow as an error. If clear, OTS$CVT_T_z does not interpret an underflow as an error.

Bit 3 — If set, OTS$CVT_T_z truncates the value. If clear, OTS$CVT_T-z rounds the value.

Bit 4 — If set, OTS$CVT_T_z ignores tabs. If clear, OTS$CVT_T_z interprets tabs as invalid characters.

Bit 5 — If set, an exponent must begin with a valid exponent letter. If clear, the exponent letter may be omitted.

Bit 6 — If set, OTS$CVT_T_z always applies the scale factor. If clear, OTS$CVT_T_z applies the scale factor only if there is no exponent present in the string.

If **flags-value** is omitted, all bits are clear.

extension-bits

OpenVMS usage	word_signed
type	word (signed)
access	write only
mechanism	by reference

Extra precision bits. The **extension-bits** argument is the address of a signed word integer containing the extra precision bits. If present, **floating-point-value** is not rounded, and the first *n* bits after truncation are returned in this argument. For G-floating and H-floating, *n* equals 11 and 15, respectively, and the bits are returned as a word, left-justified.

These values are suitable for use as the extension operand in an EMOD instruction.

The extra precision bits returned for H-floating may not be precise because calculations are only carried to 128 bits. However, the error should be small.

Description

These routines support FORTRAN D, E, F, and G input type conversion as well as similar types for other languages.

OTS$CVT_T_G and OTS$CVT_T_H provide run-time support for BASIC and FORTRAN input statements.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error; an invalid character in the input string, or the value is outside the range that can be represented. **Floating-point-value** is set to +0.0 (not reserved operand –0.0).

OTS$CVT_TZ_L—Convert Hexadecimal Text to Unsigned Integer

The Convert Hexadecimal Text to Unsigned Integer routine converts an ASCII text string representation of an unsigned hexadecimal value to an unsigned integer of an arbitrary length. The result is a longword by default, but the calling program can specify a byte, word, or longword value.

Format

```
OTS$CVT_TZ_L  fixed-or-dynamic-input-string ,varying-output-value
              [,output-value-size] [,flags-value]
```

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

fixed-or-dynamic-input-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor, fixed-length or dynamic string

Input string containing an ASCII text string representation of an unsigned hexadecimal value that OTS$CVT_TZ_L converts to an unsigned integer. The **fixed-or-dynamic-input-string** argument is the address of a descriptor pointing to the input string. Valid input characters are the space, the digits 0 through 9, and the letters A through F (lowercase letters a through f are acceptable). No sign is permitted.

varying-output-value

OpenVMS usage	varying_arg
type	unspecified
access	write only
mechanism	by reference

Unsigned byte, word, or longword that OTS$CVT_TZ_L creates when it converts the ASCII text string. (The value of the **output-value-size** argument determines whether **varying-output-value** is a byte, word, or longword.) The **varying-output-value** argument is the address of the unsigned integer.

output-value-size

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Number of bytes occupied by the integer value. The **output-value-size** argument contains the number of bytes. If the value size is zero or a negative number, OTS$CVT_TZ_L returns an input conversion error. If the number of bytes is omitted, the default is 4 (longword).

flags-value

OpenVMS usage	mask_longword
type	longword (unsigned)
access	read only
mechanism	by value

User-supplied flags that OTS$CVT_TZ_L uses to determine how blanks are interpreted. The **flags-value** argument is an unsigned longword containing these user-supplied flags.

Bit 0 If set, OTS$CVT_TZ_L ignores blanks. If clear, OTS$CVT_TZ_L interprets blanks as zeros.

If **flags-value** is omitted, the default is that all bits are clear.

Condition Values Returned

SS$_NORMAL	Normal successful completion.
OTS$_INPCONERR	Input conversion error. An invalid character, overflow, or invalid **output-value-size** occurred.

Examples

1.
```
10      !+
        ! This BASIC program converts a character string representing
        ! a hexadecimal value to a longword.
        !-

100     !+
        ! Illustrate (and test) OTS convert hex-string to longword
        !-

        EXTERNAL LONG FUNCTION OTS$CVT_TZ_L
        EXTERNAL LONG CONSTANT OTS$_INPCONERR
        INPUT "Enter hex numeric";HEXVAL$
        RET_STAT% = OTS$CVT_TZ_L(HEXVAL$, HEX% )
        PRINT "Conversion error " IF RET_STAT% = OTS$_INPCONERR
        PRINT "Decimal value of ";HEXVAL$;" is";HEX%                &
             IF RET_STAT% <> OTS$_INPCONERR
```

This BASIC example accepts a hexadecimal numeric string, converts it to a decimal integer, and prints the result. One sample of the output generated by this program is as follows:

```
$ RUN HEX
Enter hex numeric?  A
Decimal value of A is 10
```

2.
```
HEX_CONV: PROCEDURE OPTIONS (MAIN) RETURNS (FIXED BINARY (31));

%INCLUDE $STSDEF;       /* Include definition of return status values      */
DECLARE OTS$CVT_TZ_L ENTRY
        (CHARACTER (*),         /* Input string passed by descriptor       */
        FIXED BINARY (31),      /* Returned value passed by reference      */
        FIXED BINARY VALUE,     /* Size for returned value passed by value */
        FIXED BINARY VALUE)     /* Flags passed by value                   */
        RETURNS (FIXED BINARY (31))     /* Return status                   */
        OPTIONS (VARIABLE);     /* Arguments may be omitted                */

DECLARE INPUT CHARACTER (10);
DECLARE VALUE FIXED BINARY (31);
DECLARE FLAGS FIXED BINARY(31) INITIAL(1) READONLY STATIC; /* Ignore blanks */
```

```
ON ENDFILE (SYSIN) STOP;

DO WHILE ('1'B);                /* Loop continuously, until end of file     */
        PUT SKIP (2);
        GET LIST (INPUT) OPTIONS (PROMPT ('Hex value: '));
        STS$VALUE = OTS$CVT_TZ_L (INPUT, VALUE, , FLAGS);
        IF ^STS$SUCCESS THEN RETURN (STS$VALUE);
        PUT SKIP EDIT (INPUT, 'Hex equals', VALUE, 'Decimal')
                      (A,X,A,X,F(10),X,A);
        END;

END HEX_CONV;
```

This PL/I example translates a hexadecimal value in ASCII into a fixed binary value. This program continues to prompt for input values until the user types Ctrl/Z.

One sample of the output generated by this program is as follows:

```
$ RUN HEX
Hex value:  1A
1A      Hex equals       26 Decimal

Hex value:  C
C       Hex equals       12 Decimal

Hex value:  Ctrl/Z
```

OTS$DIVCx—Complex Division

The Complex Division routines return a complex result of a division on complex numbers.

Format

OTS$DIVC complex-dividend ,complex-divisor

OTS$DIVCD_R3 complex-dividend ,complex-divisor

OTS$DIVCG_R3 complex-dividend ,complex-divisor

Each of these three formats corresponds to one of the three floating-point complex types.

Returns

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	write only
mechanism	by value

Complex result of complex division. OTS$DIVC returns an F-floating complex number. OTS$DIVCD_R3 returns a D-floating complex number. OTS$DIVCG_R3 returns a G-floating complex number.

Arguments

complex-dividend

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex dividend. The **complex-dividend** argument contains a floating-point complex value. For OTS$DIVC, **complex-dividend** is an F-floating complex number. For OTS$DIVCD_R3, **complex-dividend** is a D-floating complex number. For OTS$DIVCG_R3, **complex-dividend** is a G-floating complex number.

complex-divisor

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex divisor. The **complex-divisor** argument contains the value of the divisor. For OTS$DIVC, **complex-divisor** is an F-floating complex number. For OTS$DIVCD_R3, **complex-divisor** is a D-floating complex number. For OTS$DIVCG_R3, **complex-divisor** is a G-floating complex number.

Description

These routines return a complex result of a division on complex numbers.

The complex result is computed as follows:

1. Let (a,b) represent the complex dividend.
2. Let (c,d) represent the complex divisor.
3. Let (r,i) represent the complex quotient.

The results of this computation are as follows:

$$r = (ac + bd)/(c^2 + d^2)$$

$$i = (bc - ad)/(c^2 + d^2)$$

Condition Values Signaled

SS$_FLTDIV_F	Arithmetic fault. Floating-point division by zero.
SS$_FLTOVF_F	Arithmetic fault. Floating-point overflow.

Examples

1.
```
C+
C    This FORTRAN example forms the complex
C    quotient of two complex numbers using
C    OTS$DIVC and the FORTRAN random number
C    generator RAN.
C
C    Declare Z1, Z2, Z_Q, and OTS$DIVC as complex values.
C    OTS$DIVC will return the complex quotient of Z1 divided
C    by Z2:  Z_Q = OTS$DIVC( %VAL(REAL(Z1)), %VAL(AIMAG(Z1),
C    %VAL(REAL(Z2)), %VAL(AIMAG(Z2))
C-

       COMPLEX Z1,Z2,Z_Q,OTS$DIVC
C+
C    Generate a complex number.
C-
       Z1 = (8.0,4.0)
C+
C    Generate another complex number.
C-
       Z2 = (1.0,1.0)
C+
C    Compute the complex quotient of Z1/Z2.
C-
       Z_Q = OTS$DIVC( %VAL(REAL(Z1)), %VAL(AIMAG(Z1)), %VAL(REAL(Z2)),
     +                 %VAL(AIMAG(Z2)))
       TYPE *, ' The complex quotient of',Z1,' divided by ',Z2,' is'
       TYPE *, '     ',Z_Q
       END
```

This FORTRAN program demonstrates how to call OTS$DIVC. The output generated by this program is as follows:

```
The complex quotient of (8.000000,4.000000) divided by (1.000000,1.000000)
  is (6.000000,-2.000000)
```

2.
```
C+
C    This FORTRAN example forms the complex
C    quotient of two complex numbers by using
C    OTS$DIVCG_R3 and the FORTRAN random number
C    generator RAN.
C
C     Declare Z1, Z2, and Z_Q as complex values. OTS$DIVCG_R3
C     will return the complex quotient of Z1 divided by Z2:
C     Z_Q = Z1/Z2
C-

        COMPLEX*16 Z1,Z2,Z_Q
C+
C    Generate a complex number.
C-
        Z1 = (8.0,4.0)
C+
C    Generate another complex number.
C-
        Z2 = (1.0,1.0)
C+
C    Compute the complex quotient of Z1/Z2.
C-
        Z_Q = Z1/Z2
        TYPE *, ' The complex quotient of',Z1,' divided by ',Z2,' is'
        TYPE *, '     ',Z_Q
        END
```

This FORTRAN example uses the OTS$DIVCG_R3 entry point instead. Notice the difference in the precision of the output generated:

```
 The complex quotient of (8.000000000000000,4.000000000000000) divided by
(1.000000000000000,1.000000000000000) is
      (6.000000000000000,-2.000000000000000)
```

OTS$DIV_PK_LONG—Packed Decimal Division with Long Divisor

The Packed Decimal Division with Long Divisor routine divides fixed-point decimal data, which is stored in packed decimal form, when precision and scale requirements for the quotient call for multiple precision division. The divisor must have a precision of thirty or thirty-one digits.

Format

OTS$DIV_PK_LONG packed-decimal-dividend ,packed-decimal-divisor ,divisor-precision ,packed-decimal-quotient ,quotient-precision ,precision-data ,scale-data

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

packed-decimal-dividend

OpenVMS usage	varying_arg
type	packed decimal string
access	read only
mechanism	by reference

Dividend. The **packed-decimal-dividend** argument is the address of a packed decimal string that contains the shifted dividend.

Before being passed as input, the **packed-decimal-dividend** argument is always multiplied by 10^c where c is defined as follows:

```
c = 31 - prec(packed-decimal-dividend)
```

Mutiplying **packed-decimal-dividend** by 10^c makes **packed-decimal-dividend** a 31-digit number.

packed-decimal-divisor

OpenVMS usage	varying_arg
type	packed decimal string
access	read only
mechanism	by reference

Divisor. The **packed-decimal-divisor** argument is the address of a packed decimal string that contains the divisor.

divisor-precision

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Precision of the divisor. The **divisor-precision** argument is a signed word that contains the precision of the divisor. The high-order bits are filled with zeros.

packed-decimal-quotient

OpenVMS usage	varying_arg
type	packed decimal string
access	write only
mechanism	by reference

Quotient. The **packed-decimal-quotient** argument is the address of the packed decimal string into which OTS$DIV_PK_LONG writes the quotient.

quotient-precision

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Precision of the quotient. The **quotient-precision** argument is a signed word that contains the precision of the quotient. The high-order bits are filled with zeros.

precision-data

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Additional digits of precision required. The **precision-data** argument is a signed word that contains the value of the additional digits of precision required.

OTS$DIV_PK_LONG computes the **precision-data** argument as follows:

```
precision-data = scale(packed-decimal-quotient)
+ scale(packed-decimal-divisor)
- scale(packed-decimal-dividend)
- 31 + prec(packed-decimal-dividend)
```

scale-data

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Scale factor of the decimal point. The **scale-data** argument is a signed word that contains the scale data.

OTS$DIV_PK_LONG defines the **scale-data** argument as follows:

```
scale-data = 31 - prec(packed-decimal-divisor)
```

Description

VAX

Before using this routine on an OpenVMS for VAX system, you should determine whether it is best to use OTSDIV_PK_LONG, OTSDIV_PK_SHORT, or the VAX instruction DIVP. To determine this, you must first calculate *b*, where *b* is defined as follows:

```
b = scale(packed-decimal-quotient)
+ scale(packed-decimal-divisor)
- scale(packed-decimal-dividend)
+ prec(packed-decimal-dividend)
```

If *b* is greater than 31, then OTS$DIV_PK_LONG can be used to perform the division. If *b* is less than 31, you could use the instruction DIVP instead. ♦

When using this routine on an OpenVMS AXP system, or on an OpenVMS VAX system and you have determined that you cannot use DIVP, you need to determine whether you should use OTS$DIV_PK_LONG or OTS$DIV_PK_SHORT. To determine this, you must examine the value of **scale-data**. If **scale-data** is less than or equal to 1, then you should use OTS$DIV_PK_LONG. If **scale-data** is greater than 1, you should use OTS$DIV_PK_SHORT instead.

Condition Value Signaled

SS$_FLTDIV	Fatal error. Division by zero.

Example

```
1
    OPTION                                  &
        TYPE = EXPLICIT

    !+
    !   This program uses OTS$DIV_PK_LONG to perform packed decimal
    !   division.
    !-

    !+
    !   DECLARATIONS
    !-

    DECLARE DECIMAL (31, 2)     NATIONAL_DEBT
    DECLARE DECIMAL (30, 3)     POPULATION
    DECLARE DECIMAL (10, 5)     PER_CAPITA_DEBT

    EXTERNAL SUB OTS$DIV_PK_LONG (DECIMAL(31,2), DECIMAL (30, 3), &
        WORD BY VALUE, DECIMAL(10, 5), WORD BY VALUE, WORD BY VALUE, &
        WORD BY VALUE)

    !+
    !   Prompt the user for the required input.
    !-

    INPUT   "Enter national debt: ";NATIONAL_DEBT
    INPUT   "Enter current population: ";POPULATION
```

```
!+
!   Perform the division and print the result.
!
!   scale(divd) = 2
!   scale(divr) = 3
!   scale(quot) = 5
!
!   prec(divd) = 31
!   prec(divr) = 30
!   prec(quot) = 10
!
!   prec-data  = scale(quot) + scale(divr) - scale(divd) - 31 +
!                prec(divd)
!   prec-data  =   5      +   3      -     2    - 31 +   31
!   prec-data  = 6
!
!   b = scale(quot) + scale(divr) - scale(divd) + prec(divd)
!   b =   5      +   3      -     2    +    31
!   b = 37
!
!   c = 31 - prec(divd)
!   c = 31 -   31
!   c = 0
!
!   scale-data = 31 - prec(divr)
!   scale-data = 31 -   30
!   scale-data = 1
!
!   b is greater than 31, so either OTS$DIV_PK_LONG or
!      OTS$DIV_PK_SHORT may be used to perform the division.
!      If b is less than or equal to 31, then the DIVP
!      instruction may be used.
!
!   scale-data is less than or equal to 1, so OTS$DIV_PK_LONG
!      should be used instead of OTS$DIV_PK_SHORT.
!
!-

CALL OTS$DIV_PK_LONG( NATIONAL_DEBT, POPULATION, '30'W, PER_CAPITA_DEBT, &
        '10'W, '6'W, '1'W)

PRINT   "The per capita debt is ";PER_CAPITA_DEBT
END
```

This BASIC example program uses OTS$DIV_PK_LONG to perform packed decimal division. One example of the output generated by this program is as follows:

```
$ RUN DEBT
Enter national debt: ?  12345678
Enter current population: ?  1212
The per capita debt is 10186.20297
```

OTS$DIV_PK_SHORT—Packed Decimal Division with Short Divisor

The Packed Decimal Division with Short Divisor routine divides fixed-point decimal data when precision and scale requirements for the quotient call for multiple-precision division.

Format

OTS$DIV_PK_SHORT packed-decimal-dividend ,packed-decimal-divisor ,divisor-precision ,packed-decimal-quotient ,quotient-precision ,precision-data

Returns

OpenVMS usage	cond_value
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

packed-decimal-dividend

OpenVMS usage	varying_arg
type	packed decimal string
access	read only
mechanism	by reference

Dividend. The **packed-decimal-dividend** argument is the address of a packed decimal string that contains the shifted dividend.

Before being passed as input, the **packed-decimal-dividend** argument is always multiplied by 10^c where *c* is defined as follows:

```
c = 31 - prec(packed-decimal-dividend)
```

Multiplying **packed-decimal-dividend** by 10^c makes **packed-decimal-dividend** a 31-digit number.

packed-decimal-divisor

OpenVMS usage	varying_arg
type	packed decimal string
access	read only
mechanism	by reference

Divisor. The **packed-decimal-divisor** argument is the address of a packed decimal string that contains the divisor.

divisor-precision

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Precision of the divisor. The **divisor-precision** argument is a signed word integer that contains the precision of the divisor. The high-order bits are filled with zeros.

packed-decimal-quotient

OpenVMS usage	varying_arg
type	packed decimal string
access	write only
mechanism	by reference

Quotient. The **packed-decimal-quotient** argument is the address of a packed decimal string into which OTS$DIV_PK_SHORT writes the quotient.

quotient-precision

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Precision of the quotient. The **quotient-precision** argument is a signed word that contains the precision of the quotient. The high-order bits are filled with zeros.

precision-data

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Additional digits of precision required. The **precision-data** argument is a signed word that contains the value of the additional digits of precision required.

OTS$DIV_PK_SHORT computes the **precision-data** argument as follows:

```
precision-data = scale(packed-decimal-quotient)
+ scale(packed-decimal-divisor)
- scale(packed-decimal-dividend)
- 31 + prec(packed-decimal-dividend)
```

Description

VAX

Before using this routine on an OpenVMS for VAX system, you should determine whether it is best to use OTSDIV_PK_LONG, OTSDIV_PK_SHORT, or the VAX instruction DIVP. To determine this, you must first calculate *b*, where *b* is defined as follows:

```
b = scale(packed-decimal-quotient) + scale(packed-decimal-divisor) -
  scale(packed-decimal-dividend) + prec(packed-decimal-dividend)
```

If *b* is greater than 31, then OTS$DIV_PK_SHORT can be used to perform the division. If *b* is less than 31, you could use the VAX instruction DIVP instead. ♦

When using this routine on an OpenVMS AXP system, or on an OpenVMS for VAX system and you have determined that you cannot use DIVP, you need to determine whether you should use OTS$DIV_PK_LONG or OTS$DIV_PK_SHORT. To determine this, you must examine the value of **scale-data**. If **scale-data** is less than or equal to 1, then you should use OTS$DIV_PK_LONG. If **scale-data** is greater than 1, you should use OTS$DIV_PK_SHORT instead.

Condition Value Signaled

SS$_FLTDIV	Fatal error. Division by zero.

OTS$MOVE3—Move Data Without Fill

The Move Data Without Fill routine moves up to $2^{31}-1$ bytes (2,147,483,647 bytes) from a specified source address to a specified destination address.

Format

OTS$MOVE3 length-value ,source-array ,destination-array

corresponding jsb entry point

OTS$MOVE3_R5

Returns

None.

Arguments

length-value

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Number of bytes of data to move. The **length-value** argument is a signed longword that contains the number of bytes to move. The value of **length-value** may range from 0 to 2,147,483,647 bytes.

source-array

OpenVMS usage	vector_byte_unsigned
type	byte (unsigned)
access	read only
mechanism	by reference, array reference

Data to be moved by OTS$MOVE3. The **source-array** argument contains the address of an unsigned byte array that contains this data.

destination-array

OpenVMS usage	vector_byte_unsigned
type	byte (unsigned)
access	write only
mechanism	by reference, array reference

Address into which **source-array** will be moved. The **destination-array** argument is the address of an unsigned byte array into which OTS$MOVE3 writes the source data.

Description

OTS$MOVE3 performs the same function as the VAX MOVC3 instruction except that the **length-value** is a longword integer rather than a word integer. When called from the JSB entry point, the register outputs of OTS$MOVE3_R5 follow the same pattern as those of the MOVC3 instruction:

R0	0
R1	Address of one byte beyond the source string
R2	0
R3	Address of one byte beyond the destination string
R4	0
R5	0

For more information, see the description of the MOVC3 instruction in the *VAX Architecture Reference Manual*. See also the routine LIB$MOVC3, which is a callable version of the MOVC3 instruction.

Condition Values Returned

None.

OTS$MOVE5—Move Data with Fill

The Move Data with Fill routine moves up to 2^{31}—1 bytes (2,147,483,647 bytes) from a specified source address to a specified destination address, with separate source and destination lengths, and with fill. Overlap of the source and destination arrays does not affect the result.

Format

OTS$MOVE5 longword-int-source-length ,source-array ,fill-value
,longword-int-dest-length ,destination-array

corresponding jsb entry point

OTS$MOVE5_R5

Returns

None.

Arguments

longword-int-source-length

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Number of bytes of data to move. The **longword-int-source-length** argument is a signed longword that contains this number. The value of **longword-int-source-length** may range from 0 to 2,147,483,647.

source-array

OpenVMS usage	vector_byte_unsigned
type	byte (unsigned)
access	read only
mechanism	by reference, array reference

Data to be moved by OTS$MOVE5. The **source-array** argument contains the address of an unsigned byte array that contains this data.

fill-value

OpenVMS usage	byte_unsigned
type	byte (unsigned)
access	read only
mechanism	by value

Character used to pad the source data if **longword-int-source-length** is less than **longword-int-dest-length**. The **fill-value** argument contains the address of an unsigned byte that is this character.

longword-int-dest-length

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Size of the destination area in bytes. The **longword-int-dest-length** argument is a signed longword containing this size. The value of **longword-int-dest-length** may range from 0 through 2,147,483,647.

destination-array

OpenVMS usage	vector_byte_unsigned
type	byte (unsigned)
access	write only
mechanism	by reference, array reference

Address into which **source-array** is moved. The **destination-array** argument is the address of an unsigned byte array into which OTS$MOVE5 writes the source data.

Description

OTS$MOVE5 performs the same function as the VAX MOVC5 instruction except that the **longword-int-source-length** and **longword-int-dest-length** arguments are longword integers rather than word integers. When called from the JSB entry point, the register outputs of OTS$MOVE5_R5 follow the same pattern as those of the MOVC5 instruction:

R0	Number of unmoved bytes remaining in source string
R1	Address of one byte beyond the source string
R2	0
R3	Address of one byte beyond the destination string
R4	0
R5	0

For more information, see the description of the MOVC5 instruction in the *VAX Architecture Reference Manual*. See also the routine LIB$MOVC5, which is a callable version of the MOVC5 instruction.

Condition Values Returned

None.

OTS$MULCx—Complex Multiplication

The Complex Multiplication routines calculate the complex product of two complex values.

Format

OTS$MULCD_R3 complex-multiplier ,complex-multiplicand

OTS$MULCG_R3 complex-multiplier ,complex-multiplicand

These formats correspond to the D-floating and G-floating complex types.

Returns

OpenVMS usage	complex_number
type	D_floating complex, G_floating complex
access	write only
mechanism	by value

Complex result of multiplying two complex numbers. OTS$MULCD_R3 returns a D-floating complex number. OTS$MULCG_R3 returns a G-floating complex number.

Arguments

complex-multiplier

OpenVMS usage	complex_number
type	D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex multiplier. The **complex-multiplier** argument contains the complex multiplier. For OTS$MULCD_R3, **complex-multiplier** is a D-floating complex number. For OTS$MULCG_R3, **complex-multiplier** is a G-floating complex number.

complex-multiplicand

OpenVMS usage	complex_number
type	D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex multiplicand. The **complex-multiplicand** argument contains the complex multiplicand. For OTS$MULCD_R3, **complex-multiplicand** is a D-floating complex number. For OTS$MULCG_R3, **complex-multiplicand** is an F-floating complex number.

Description

OTS$MULCD_R3 and OTS$MULCG_R3 calculate the complex product of two complex values.

The complex product is computed as follows:

1. Let (a,b) represent the complex multiplier.
2. Let (c,d) represent the complex multiplicand.

3. Let (r,i) represent the complex product.

The results of this computation are as follows:

$$(a,b) * (c,d) = (ac - bd) + \sqrt{-1}(ad + bc)$$

$$Therefore: r = ac - bd$$

$$Therefore: i = ad + bc$$

Condition Values Signaled

SS$_FLTOVF_F	Floating value overflow can occur.
SS$_ROPRAND	Reserved operand. OTS$MULCx encountered a floating-point reserved operand because of incorrect user input. A floating-point reserved operand is a floating-point datum with a sign bit of 1 and a biased exponent of zero. Floating-point reserved operands are reserved for future use by Digital.

Example

```
C+
C    This FORTRAN example forms the product of
C    two complex numbers using OTS$MULCD_R3
C    and the FORTRAN random number generator RAN.
C
C    Declare Z1, Z2, and Z_Q as complex values. OTS$MULCD_R3
C    returns the complex product of Z1 times Z2:
C    Z_Q = Z1 * Z2
C-

       COMPLEX*16 Z1,Z2,Z_Q
C+
C    Generate a complex number.
C-
       Z1 = (8.0,4.0)
C+
C    Generate another complex number.
C-
       Z2 = (2.0,3.0)
C+
C    Compute the complex product of Z1*Z2.
C-
       Z_Q = Z1 * Z2
       TYPE *, ' The complex product of',Z1,' times ',Z2,' is'
       TYPE *, '     ',Z_Q
       END
```

This FORTRAN example uses OTS$MULCD_R3 to multiply two complex numbers. The output generated by this program is as follows:

```
 The complex product of (8.000000000000000,4.000000000000000) times
(2.000000000000000,3.000000000000000) is
     (4.000000000000000,32.00000000000000)
```

OTS$POWCxCx—Raise a Complex Base to a Complex Floating-Point Exponent

The Raise a Complex Base to a Complex Floating-Point Exponent routines raise a complex base to a complex exponent.

Format

OTS$POWCC complex-base ,complex-exponent-value

OTS$POWCDCD_R3 complex-base ,complex-exponent-value

OTS$POWCGCG_R3 complex-base ,complex-exponent-value

Each of these three formats corresponds to one of the three floating-point complex types.

Returns

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	write only
mechanism	by value

Result of raising a complex base to a complex exponent. OTS$POWCC returns an F-floating complex number. OTS$POWCDCD_R3 returns a D-floating complex number. OTS$POWCGCG_R3 returns a G-floating complex number.

Arguments

complex-base

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex base. The **complex-base** argument contains the value of the base. For OTS$POWCC, **complex-base** is an F-floating complex number. For OTS$POWCDCD_R3, **complex-base** is a D-floating complex number. For OTS$POWCGCG_R3, **complex-base** is a G-floating complex number.

complex-exponent-value

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex exponent. The **complex-exponent-value** argument contains the value of the exponent. For OTS$POWCC, **complex-exponent-value** is an F-floating complex number. For OTS$POWCDCD_R3, **complex-exponent-value** is a D-floating complex number. For OTS$POWCGCG_R3, **complex-exponent-value** is a G-floating complex number.

Description

OTS$POWCC, OTS$POWCDCD_R3 and OTS$POWCGCG_R3 raise a complex base to a complex exponent. The American National Standard FORTRAN–77 (ANSI X3.9–1978) defines complex exponentiation as follows:

$$x^y = exp(y * log(x))$$

In this example, x and y are type COMPLEX.

Condition Values Signaled

MTH$_INVARGMAT	Invalid argument in math library. Base is (0.,0.).
MTH$_FLOOVEMAT	Floating-point overflow in math library.
SS$_ROPRAND	Reserved operand.

Examples

1.
```
C+
C    This FORTRAN example raises a complex base to a complex
C    power using OTS$POWCC.
C
C    Declare Z1, Z2, Z3, and OTS$POWCC as complex values. Then OTS$POWCC
C    returns the complex result of Z1**Z2:   Z3 = OTS$POWCC(Z1,Z2),
C    where Z1 and Z2 are passed by value.
C-

       COMPLEX Z1,Z2,Z3,OTS$POWCC
C+
C    Generate a complex base.
C-
       Z1 = (2.0,3.0)
C+
C    Generate a complex power.
C-
       Z2 = (1.0,2.0)
C+
C    Compute the complex value of Z1**Z2.
C-
       Z3 = OTS$POWCC( %VAL(REAL(Z1)), %VAL(AIMAG(Z1)),
     +                 %VAL(REAL(Z2)), %VAL(AIMAG(Z2)))
       TYPE *, ' The value of',Z1,'**',Z2,' is',Z3
       END
```

This FORTRAN example uses OTS$POWCC to raise an F-floating complex base to an F-floating complex exponent.

The output generated by this program is as follows:

```
 The value of (2.000000,3.000000)** (1.000000,2.000000) is
(-0.4639565,-0.1995301)
```

2.
```
C+
C    This FORTRAN example raises a complex base to a complex
C    power using OTS$POWCGCG_R3.
C
C    Declare Z1, Z2, and Z3 as complex values. OTS$POWCGCG_R3
C    returns the complex result of Z1**Z2: Z3 = Z1**Z2.
C-

        COMPLEX*16 Z1,Z2,Z3
C+
C    Generate a complex base.
C-
        Z1 = (2.0,3.0)
C+
C    Generate a complex power.
C-
        Z2 = (1.0,2.0)
C+
C    Compute the complex value of Z1**Z2.
C-
        Z3 = Z1**Z2
        TYPE 1,Z1,Z2,Z3
    1   FORMAT(' The value of (',F11.8,',',F11.8,')**(',F11.8,
      + ',',F11.8,') is (',F11.8,',',F11.8,').')
        END
```

This FORTRAN example program shows how to use OTS$POWCGCG_R3. Notice the high precision in the output generated by this program:

```
The value of ( 2.00000000, 3.00000000)**( 1.00000000, 2.00000000) is
(-0.46395650,-0.46395650).
```

OTS$POWCxJ—Raise a Complex Base to a Signed Longword Integer Exponent

The Raise a Complex Base to a Signed Longword Integer Exponent routines return the complex result of raising a complex base to an integer exponent.

Format

OTS$POWCJ complex-base ,longword-integer-exponent

OTS$POWCDJ_R3 complex-base ,longword-integer-exponent

OTS$POWCGJ_R3 complex-base ,longword-integer-exponent

Each of these three formats corresponds to one of the three floating-point complex types.

Returns

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	write only
mechanism	by value

Complex result of raising a complex base to an integer exponent. OTS$POWCJ returns an F-floating complex number. OTS$POWCDJ_R3 returns a D-floating complex number. OTS$POWCGJ_R3 returns a G-floating complex number. In each format, the result and base are of the same data type.

Arguments

complex-base

OpenVMS usage	complex_number
type	F_floating complex, D_floating complex, G_floating complex
access	read only
mechanism	by value

Complex base. The **complex-base** argument contains the complex base. For OTS$POWCJ, **complex-base** is an F-floating complex number. For OTS$POWCDJ_R3, **complex-base** is a D-floating complex number. For OTS$POWCGJ_R3, **complex-base** is a G-floating complex number.

longword-integer-exponent

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Exponent. The **longword-integer-exponent** argument is a signed longword containing the exponent.

Description

OTS$POWCJ, OTS$POWCDJ_R3, and OTS$POWCGJ_R3 return the complex result of raising a complex base to an integer exponent. The complex result is as follows:

Base	Exponent	Result
Any	> 0	The product of (base**2^i), where i is each nonzero bit in **longword-integer-exponent**
(0.,0.)	≤ 0	Undefined exponentiation
Not (0.,0.)	< 0	The product of (base**2^i), where i is each nonzero bit in **longword-integer-exponent**
Not (0.,0.)	0	(1.0,0.0)

Condition Values Signaled

SS$_FLTDIV	Floating-point division by zero.
SS$_FLTOVF	Floating-point overflow.
MTH$_UNDEXP	Undefined exponentiation.

Example

```
C+
C    This FORTRAN example raises a complex base to
C    a NONNEGATIVE integer power using OTS$POWCJ.
C
C    Declare Z1, Z2, Z3, and OTS$POWCJ as complex values.
C    Then OTS$POWCJ returns the complex result of
C    Z1**Z2:   Z3 = OTS$POWCJ(Z1,Z2),
C    where Z1 and Z2 are passed by value.
C-
       COMPLEX Z1,Z3,OTS$POWCJ
       INTEGER Z2
C+
C    Generate a complex base.
C-
       Z1 = (2.0,3.0)
C+
C    Generate an integer power.
C-
       Z2 = 2

C+
C    Compute the complex value of Z1**Z2.
C-
       Z3 = OTS$POWCJ( %VAL(REAL(Z1)), %VAL(AIMAG(Z1)), %VAL(Z2))
       TYPE 1,Z1,Z2,Z3
  1    FORMAT(' The value of (',F10.8,',',F11.8,')**',I1,' is
     + (',F11.8,',',F12.8,').')
       END
```

The output generated by this FORTRAN program is as follows:

```
 The value of (2.00000000, 3.00000000)**2 is
 (-5.00000000, 12.00000000).
```

OTS$POWDD—Raise a D-Floating Base to a D-Floating Exponent

The Raise a D-Floating Base to a D-Floating Exponent routine raises a D-floating base to a D-floating exponent.

Format

OTS$POWDD D-floating-point-base ,D-floating-point-exponent

Returns

OpenVMS usage	floating_point
type	D_floating
access	write only
mechanism	by value

Arguments

D-floating-point-base

OpenVMS usage	floating_point
type	D_floating
access	read only
mechanism	by value

Base. The **D-floating-point-base** argument is a D-floating number containing the base.

D-floating-point-exponent

OpenVMS usage	floating_point
type	D_floating
access	read only
mechanism	by value

Exponent. The **D-floating-point-exponent** argument is a D-floating number that contains the exponent.

Description

OTS$POWDD raises a D-floating base to a D-floating exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The D-floating result for OTS$POWDD is given by the following:

Base	Exponent	Result
= 0	> 0	0.0
= 0	= 0	Undefined exponentiation
= 0	< 0	Undefined exponentiation
< 0	Any	Undefined exponentiation
> 0	> 0	$2^{[exponent * \log2(base)]}$
> 0	= 0	1.0

Base	Exponent	Result
> 0	< 0	$2^{[exponent*\log2(base)]}$

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative, or if the base is negative.

Condition Values Signaled

MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **D-floating-point-base** is zero and **D-floating-point-exponent** is zero or negative, or if the **D-floating-point-base** is negative.

OTS$POWDR—Raise a D-Floating Base to an F-Floating Exponent

The Raise a D-Floating Base to an F-Floating Exponent routine raises a D-floating base to an F-floating exponent.

Format

OTS$POWDR D-floating-point-base ,F-floating-point-exponent

Returns

OpenVMS usage	floating_point
type	D_floating
access	write only
mechanism	by value

Arguments

D-floating-point-base

OpenVMS usage	floating_point
type	D_floating
access	read only
mechanism	by value

Base. The **D-floating-point-base** argument is a D-floating number containing the base.

F-floating-point-exponent

OpenVMS usage	floating_point
type	F_floating
access	read only
mechanism	by value

Exponent. The **F-floating-point-exponent** argument is an F-floating number that contains the exponent.

Description

OTS$POWDR raises a D-floating base to an F-floating exponent.

The internal calculations and the floating-point result have the same precision as the base value.

OTS$POWDR converts the F-floating exponent to a D-floating number. The D-floating result for OTS$POWDR is given by the following:

Base	Exponent	Result
= 0	> 0	0.0
= 0	= 0	Undefined exponentiation
= 0	< 0	Undefined exponentiation
< 0	Any	Undefined exponentiation
> 0	> 0	$2^{[exponent * \log2(base)]}$
> 0	= 0	1.0

Base	Exponent	Result
> 0	< 0	$2^{[exponent*\log2(base)]}$

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative, or if the base is negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **D-floating-point-base** is zero and **F-floating-point-exponent** is zero or negative, or if the **D-floating-point-base** is negative.

OTS$POWDJ—Raise a D-Floating Base to a Longword Exponent

The Raise a D-Floating Base to a Longword Exponent routine raises a D-floating base to a longword exponent.

Format

OTS$POWDJ D-floating-point-base ,longword-integer-exponent

Returns

OpenVMS usage	floating_point
type	D_floating
access	write only
mechanism	by value

Arguments

D-floating-point-base

OpenVMS usage	floating_point
type	D_floating
access	read only
mechanism	by value

Base. The **D-floating-point-base** argument is a D-floating number containing the base.

longword-integer-exponent

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Exponent. The **longword-integer-exponent** argument is a signed longword that contains the signed longword integer exponent.

Description

OTS$POWDJ raises a D-floating base to a longword exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The floating-point result is as follows:

Base	Exponent	Result
Any	> 0	Product of (base**2^i) where *i* is each nonzero bit position in **longword-integer-exponent**
> 0	= 0	1.0
= 0	= 0	Undefined exponentiation
< 0	= 0	1.0
> 0	< 0	1.0/ (base**2^i), where *i* is each nonzero bit position in **longword-integer-exponent**

Base	Exponent	Result
= 0	< 0	Undefined exponentiation
< 0	< 0	1.0/ (base**2^i) where *i* is each nonzero bit position in **longword-integer-exponent**

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **D-floating-point-base** is zero and **longword-integer-exponent** is zero or negative, or if the **D-floating-point-base** is negative.

OTS$POWGG—Raise a G-Floating Base to a G-Floating Exponent

The Raise a G-Floating Base to a G-Floating Exponent routine raises a G-floating base to a G-floating exponent.

Format

OTS$POWGG G-floating-point-base ,G-floating-point-exponent

Returns

OpenVMS usage	floating_point
type	G_floating
access	write only
mechanism	by value

Arguments

G-floating-point-base

OpenVMS usage	floating_point
type	G_floating
access	read only
mechanism	by value

Base that OTS$POWGG raises to a G-floating exponent. The **G-floating-point-base** argument is a G-floating number containing the base.

G-floating-point-exponent

OpenVMS usage	floating_point
type	G_floating
access	read only
mechanism	by value

Exponent to which OTS$POWGG raises the base. The **G-floating-point-exponent** argument is a G-floating number containing the exponent.

Description

OTS$POWGG raises a G-floating base to a G-floating exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The G-floating result for OTS$POWGG is as follows:

Base	Exponent	Result
= 0	> 0	0.0
= 0	= 0	Undefined exponentiation
= 0	< 0	Undefined exponentiation
< 0	Any	Undefined exponentiation
> 0	> 0	$2^{[exponent * \log2(base)]}$
> 0	= 0	1.0

Base	Exponent	Result
> 0	< 0	$2^{[exponent*\log2(base)]}$

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative, or if the base is negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponent. This error is signaled if **G-floating-point-base** is zero and **G-floating-point-exponent** is zero or negative, or if **G-floating-point-base** is negative.

Example

```
C+
C   This example demonstrates the use of OTS$POWGG,
C   which raises a G-floating point base
C   to a G-floating point power.
C-
        REAL*8 X,Y,RESULT,OTS$POWGG
C+
C   The arguments of OTS$POWGG are passed by value. FORTRAN can
C   only pass INTEGER and REAL*4 expressions as VALUE. Since
C   INTEGER and REAL*4 values are one longword long, while REAL*8
C   values are two longwords long, equate the base (and power) to
C   two-dimensional INTEGER vectors. These vectors will be passed
C   by VALUE.
C-
        INTEGER N(2),M(2)
        EQUIVALENCE (N(1),X), (M(1),Y)
        X = 8.0
        Y = 2.0
C+
C  To pass X by value, pass N(1) and N(2) by value. Similarly for Y.
C-
        RESULT = OTS$POWGG(%VAL(N(1)),%VAL(N(2)),%VAL(M(1)),%VAL(M(2)))
        TYPE *,' 8.0**2.0 IS ',RESULT
        X = 9.0
        Y = -0.5
C+
C   In FORTRAN, OTS$POWWGG is indirectly called by simply using the
C   exponentiation operator.
C-
        RESULT = X**Y
        TYPE *,' 9.0**-0.5 IS ',RESULT
        END
```

This FORTRAN example uses OTS$POWGG to raise a G-floating base to a G-floating exponent.

The output generated by this example is as follows:

```
8.0**2.0 IS    64.0000000000000
9.0**-0.5 IS  0.333333333333333
```

OTS$POWGJ—Raise a G-Floating Base to a Longword Exponent

The Raise a G-Floating Base to a Longword Exponent routine raises a G-floating base to a longword exponent.

Format

OTS$POWGJ G-floating-point-base ,longword-integer-exponent

Returns

OpenVMS usage	floating_point
type	G_floating
access	write only
mechanism	by value

Arguments

G-floating-point-base

OpenVMS usage	floating_point
type	G_floating
access	read only
mechanism	by value

Base that OTS$POWGJ raises to a longword exponent. The **G-floating-point-base** argument is a G-floating number containing the base.

longword-integer-exponent

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Exponent to which OTS$POWGJ raises the base. The **longword-integer-exponent** argument is a signed longword containing the exponent.

Description

OTS$POWGJ raises a G-floating base to a longword exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The floating-point result is as follows:

Base	Exponent	Result
Any	> 0	Product of (base**2^i) where *i* is each nonzero bit position in **longword-integer-exponent**
> 0	= 0	1.0
= 0	= 0	Undefined exponentiation
< 0	= 0	1.0
> 0	< 0	1.0/ (base**2^i), where *i* is each nonzero bit position in **longword-integer-exponent**

Base	Exponent	Result
= 0	< 0	Undefined exponentiation
< 0	< 0	1.0/ (base**2^i) where *i* is each nonzero bit position in **longword-integer-exponent**

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponent. This error is signaled if **G-floating-point-base** is zero and **longword-integer-exponent** is zero or negative, or if **G-floating-point-base** is negative.

OTS$POWHH_R3—Raise an H-Floating Base to an H-Floating Exponent (VAX VMS Only)

VAX

On an OpenVMS for VAX system, the Raise an H-Floating Base to an H-Floating Exponent routine raises an H-floating base to an H-floating exponent.

Format

OTS$POWHH_R3 H-floating-point-base ,H-floating-point-exponent

Returns

OpenVMS usage	floating_point
type	H_floating
access	write only
mechanism	by value

Arguments

H-floating-point-base

OpenVMS usage	floating_point
type	H_floating
access	read only
mechanism	by value

Base. The **H-floating-point-base** argument is an H-floating number containing the base.

H-floating-point-exponent

OpenVMS usage	floating_point
type	H_floating
access	read only
mechanism	by value

Exponent. The **H-floating-point-exponent** argument is an H-floating number that contains the H-floating exponent.

Description

OTS$POWHH_R3 raises an H-floating base to an H-floating exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The H-floating result for OTS$POWHH_R3 is as follows:

Base	Exponent	Result
= 0	> 0	0.0
= 0	= 0	Undefined exponentiation
= 0	< 0	Undefined exponentiation
< 0	Any	Undefined exponentiation
> 0	> 0	$2^{[exponent*\log2(base)]}$

Base	Exponent	Result
> 0	= 0	1.0
> 0	< 0	$2^{[exponent*\log2(base)]}$

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative, or if the base is negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **H-floating-point-base** is zero and **H-floating-point-exponent** is zero or negative, or if the **H-floating-point-base** is negative.

Example

```
C+
C Example of OTS$POWHH, which raises an H_floating
C point base to an H_floating point power. In FORTRAN,
C it is not directly called.
C-
        REAL*16 X,Y,RESULT
        X = 9877356535.0
        Y = -0.5837653
C+
C In FORTRAN, OTS$POWWHH is indirectly called by simply using the
C exponentiation operator.
C-
        RESULT = X**Y
        TYPE *,' 9877356535.0**-0.5837653 IS ',RESULT
        END
```

This FORTRAN example demonstrates how to call OTS$POWHH_R3 to raise an H-floating base to an H-floating power.

The output generated by this program is as follows:

```
 9877356535.0**-0.5837653 IS   1.463779145994628357482343598205427E-0006♦
```

OTS$POWHJ_R3—Raise an H-Floating Base to a Longword Exponent (VAX VMS Only)

VAX

On an OpenVMS for VAX system, the Raise an H-Floating Base to a Longword Exponent routine raises an H-floating base to a longword exponent.

Format

OTS$POWHJ_R3 H-floating-point-base ,longword-integer-exponent

Returns

OpenVMS usage	floating_point
type	H_floating
access	write only
mechanism	by value

Arguments

H-floating-point-base

OpenVMS usage	floating_point
type	H_floating
access	read only
mechanism	by value

Base. The **H-floating-point-base** argument is an H-floating number containing the base.

longword-integer-exponent

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Exponent. The **longword-integer-exponent** argument is a signed longword that contains the signed longword exponent.

Description

OTS$POWHJ_R3 raises an H-floating base to a longword exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The floating-point result is as follows:

Base	Exponent	Result
Any	> 0	Product of (base**2^i) where i is each nonzero bit position in **longword-integer-exponent**
> 0	= 0	1.0
= 0	= 0	Undefined exponentiation
< 0	= 0	1.0

Base	Exponent	Result
> 0	< 0	1.0/ (base**2^i), where *i* is each nonzero bit position in **longword-integer-exponent**
= 0	< 0	Undefined exponentiation
< 0	< 0	1.0/ (base**2^i) where *i* is each nonzero bit position in **longword-integer-exponent**

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **H-floating-point-base** is zero and **longword-integer-exponent** is zero or negative, or if the **H-floating-point-base** is negative.♦

OTS$POWII—Raise a Word Base to a Word Exponent

The Raise a Word Base to a Word Exponent routine raises a word base to a word exponent.

Format

OTS$POWII word-integer-base ,word-integer-exponent

Returns

OpenVMS usage	word_signed
type	word (signed)
access	write only
mechanism	by value

Arguments

word-integer-base

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Base. The **word-integer-base** argument is a signed word containing the base.

word-integer-exponent

OpenVMS usage	word_signed
type	word (signed)
access	read only
mechanism	by value

Exponent. The **word-integer-exponent** argument is a signed word containing the exponent.

Condition Values Signaled

SS$_FLTDIV	Arithmetic trap. This error is signaled by the hardware if a floating-point division by zero occurs.
SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **word-integer-base** is zero and **word-integer-exponent** is zero or negative, or if **word-integer-base** is negative.

OTS$POWJJ—Raise a Longword Base to a Longword Exponent

The Raise a Longword Base to a Longword Exponent routine raises a signed longword base to a signed longword exponent.

Format

OTS$POWJJ longword-integer-base ,longword-integer-exponent

Returns

OpenVMS usage	longword_signed
type	longword (signed)
access	write only
mechanism	by value

Arguments

longword-integer-base

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Base. The **longword-integer-base** argument is a signed longword containing the base.

longword-integer-exponent

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Exponent. The **longword-integer-exponent** argument is a signed longword containing the exponent.

Condition Values Signaled

SS$_FLTDIV	Arithmetic trap. This error is signaled by the hardware if a floating-point division by zero occurs.
SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **longword-integer-base** is zero and **longword-integer-exponent** is zero or negative, or if **longword-integer-base** is negative.

OTS$POWLULU—Raise an Unsigned Longword Base to an Unsigned Longword Exponent

The Raise an Unsigned Longword Base to an Unsigned Longword Exponent routine raises an unsigned longword integer base to an unsigned longword integer exponent.

Format

OTS$POWLULU unsigned-lword-int-base, unsigned-lword-int-exponent

Returns

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	write only
mechanism	by value

Arguments

unsigned-lword-int-base

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Unsigned longword integer base. The **unsigned-lword-int-base** argument contains the value of the integer base.

unsigned-lword-int-exponent

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Unsigned longword integer exponent. The **unsigned-lword-int-exponent** argument contains the value of the integer exponent.

Description

OTS$POWLULU returns the unsigned longword integer result of raising an unsigned longword integer base to an unsigned longword integer exponent. Note that overflow cannot occur in this routine. If the result or intermediate result is greater than 32 bits, the low-order 32 bits are used.

Condition Values Signaled

MTH$_UNDEXP	Both the base and exponent values are zero.

OTS$POWxLU—Raise a Floating-Point Base to an Unsigned Longword Integer Exponent

The Raise a Floating-Point Base to an Unsigned Longword Integer Exponent routines raises a floating-point base to an unsigned longword integer exponent.

Format

OTS$POWRLU floating-point-base ,unsigned-lword-int-exponent

OTS$POWDLU floating-point-base ,unsigned-lword-int-exponent

OTS$POWGLU floating-point-base ,unsigned-lword-int-exponent

VAX

OTS$POWHLU_R3 floating-point-base ,unsigned-lword-int-exponent ♦

Returns

OpenVMS usage	floating_point
type	F_floating, D_floating, G_floating, H_floating
access	write only
mechanism	by value

Result of raising a floating-point base to an unsigned longword integer exponent. OTS$POWRLU returns an F-floating number. OTS$POWDLU returns a D-floating number. OTS$POWGLU returns a G-floating number.

VAX

OTS$POWHLU_R3 returns an H-floating number. ♦

Arguments

floating-point-base

OpenVMS usage	floating_point
type	F_floating, D_floating, G_floating, H_floating
access	read only
mechanism	by value

Floating-point base. The **floating-point-base** argument contains the value of the base. For OTS$POWRLU, **floating-point-base** is an F-floating number. For OTS$POWDLU, **floating-point-base** is a D-floating number. For OTS$POWGLU, **floating-point-base** is a G-floating number. For OTS$POWHLU_R3, **floating-point-base** is an H-floating number.

unsigned-lword-int-exponent

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Integer exponent. The **unsigned-lword-int-exponent** argument contains the value of the unsigned longword integer exponent.

Description

OTS$POWRLU, OTS$POWDLU, OTS$POWGLU, and OTS$POWHLU_R3 return the result of raising a floating-point base to an unsigned longword integer exponent. The floating-point result is as follows:

Base	Exponent	Result
Any	> 0	Product of (base*2^i) where *i* is each nonzero bit position in **longword-integer-exponent**
> 0	= 0	1.0
= 0	= 0	Undefined exponentiation
< 0	= 0	1.0

Condition Values Signaled

MTH$_FLOOVEMAT	Floating-point overflow in math library
MTH$_FLOUNDMAT	Floating-point underflow in math library. This can only occur if the caller has floating-point underflow enabled.
MTH$_UNDEXP	Undefined exponentiation. This occurs if both the **floating-point-base** and **unsigned-longword-integer-exponent** arguments are zero.

OTS$POWRD—Raise an F-Floating Base to a D-Floating Exponent

The Raise an F-Floating Base to a D-Floating Exponent routine raises an F-floating base to a D-floating exponent.

Format

OTS$POWRD F-floating-point-base ,D-floating-point-exponent

Returns

OpenVMS usage	floating_point
type	D_floating
access	write only
mechanism	by value

Arguments

F-floating-point-base

OpenVMS usage	floating_point
type	F_floating
access	read only
mechanism	by value

Base. The **F-floating-point-base** argument is an F-floating number containing the base.

D-floating-point-exponent

OpenVMS usage	floating_point
type	D_floating
access	read only
mechanism	by value

Exponent. The **D-floating-point-exponent** argument is a D-floating number that contains the exponent.

Description

OTS$POWRD raises an F-floating base to a D-floating exponent.

The internal calculations and the floating-point result have the same precision as the base value.

OTS$POWRD first converts the F-floating base to D-floating. The D-floating result for OTS$POWRD is as follows:

Base	Exponent	Result
= 0	> 0	0.0
= 0	= 0	Undefined exponentiation
= 0	< 0	Undefined exponentiation
< 0	Any	Undefined exponentiation
> 0	> 0	$2^{[exponent*LOG2(base)]}$
> 0	= 0	1.0

Base	Exponent	Result
> 0	< 0	$2^{[exponent*LOG2(base)]}$

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative, or if the base is negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **F-floating-point-base** is zero and **D-floating-point-exponent** is zero or negative, or if **F-floating-point-base** is negative.

Example

```
C+
C   This FORTRAN example demonstrates the use
C   of OTS$POWRD, which raises an F-floating point
C   base to a D-floating point exponent. The result is a
C   D-floating value.
C-

        REAL*4 X
        REAL*8 Y,RESULT,OTS$POWRD
        INTEGER M(2)
        EQUIVALENCE (M(1),Y)
        X = 9768.0
        Y = 9.0

C+
C  The arguments of OTS$POWRD are passed by value.
C-

        RESULT = OTS$POWRD(%VAL(X),%VAL(M(1)),%VAL(M(2)))
        TYPE *,' 9768.0**9.0 IS ',RESULT
        X = 7689.0
        Y = -0.587436654545

C+
C   In FORTRAN, OTS$POWRD is indirectly called by simply
C   using the exponentiation operator.
C-

        RESULT = X**Y
        TYPE *,' 7689.0**-0.587436654545 IS ',RESULT
        END
```

This FORTRAN example uses OTS$POWRD to raise an F-floating base to a D-floating exponent. Notice the difference in the precision of the result produced by this routine in comparison to the result produced by OTS$POWRR.

The output generated by this program is as follows:

```
9768.0**9.0 IS   8.0956338648832908E+35
7689.0**-0.587436654545 IS   5.2155199252836588E-03
```

OTS$POWRJ—Raise an F-Floating Base to a Longword Exponent

The Raise an F-Floating Base to a Longword Exponent routine raises an F-floating base to a longword exponent.

Format

OTS$POWRJ F-floating-point-base ,longword-integer-exponent

Returns

OpenVMS usage	floating_point
type	F_floating
access	write only
mechanism	by value

Arguments

F-floating-point-base

OpenVMS usage	floating_point
type	F_floating
access	read only
mechanism	by value

Base. The **F-floating-point-base** argument is an F-floating number containing the base.

longword-integer-exponent

OpenVMS usage	longword_signed
type	longword (signed)
access	read only
mechanism	by value

Exponent. The **longword-integer-exponent** argument is a signed longword that contains the longword exponent.

Description

OTS$POWRJ raises an F-floating base to a longword exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The floating-point result is as follows:

Base	Exponent	Result
Any	> 0	Product of (base**2^i) where i is each nonzero bit position in **longword-integer-exponent**
> 0	= 0	1.0
= 0	= 0	Undefined exponentiation
< 0	= 0	1.0
> 0	< 0	1.0/ (base**2^i), where i is each nonzero bit position in **longword-integer-exponent**

Base	Exponent	Result
= 0	< 0	Undefined exponentiation
< 0	< 0	1.0/ (base**2^i) where i is each nonzero bit position in **longword-integer-exponent**

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **F-floating-point-base** is zero and **longword-integer-exponent** is zero or negative, or if **F-floating-point-base** is negative.

OTS$POWRR—Raise an F-Floating Base to an F-Floating Exponent

The Raise an F-Floating Base to an F-Floating Exponent routine raises an F-floating base to an F-floating exponent.

Format

OTS$POWRR F-floating-point-base ,F-floating-point-exponent

Returns

OpenVMS usage	floating_point
type	F_floating
access	write only
mechanism	by value

Arguments

F-floating-point-base

OpenVMS usage	floating_point
type	F_floating
access	read only
mechanism	by value

Base. The **F-floating-point-base** argument is an F-floating number containing the base.

F-floating-point-exponent

OpenVMS usage	floating_point
type	F_floating
access	read only
mechanism	by value

Exponent. The **F-floating-point-exponent** argument is an F-floating number that contains the exponent.

Description

OTS$POWRR raises an F-floating base to an F-floating exponent.

The internal calculations and the floating-point result have the same precision as the base value.

The F-floating result for OTS$POWRR is as follows:

Base	Exponent	Result
= 0	> 0	0.0
= 0	= 0	Undefined exponentiation
= 0	< 0	Undefined exponentiation
< 0	Any	Undefined exponentiation
> 0	> 0	$2^{[exponent*\log2(base)]}$
> 0	= 0	1.0

Base	Exponent	Result
> 0	< 0	$2^{[exponent*\log2(base)]}$

Floating-point overflow can occur.

Undefined exponentiation occurs if the base is zero and the exponent is zero or negative, or if the base is negative.

Condition Values Signaled

SS$_FLTOVF	Arithmetic trap. This error is signaled by the hardware if a floating-point overflow occurs.
MTH$_FLOOVEMAT	Floating-point overflow in math library.
MTH$_FLOUNDMAT	Floating-point underflow in math library.
MTH$_UNDEXP	Undefined exponentiation. This error is signaled if **F-floating-point-base** is zero and **F-floating-point-exponent** is zero or negative, or if **F-floating-point-base** is negative.

Example

```
C+
C  This FORTRAN example demonstrates the use
C  of OTS$POWRR, which raises an F-floating
C  point base to an F-floating point power.
C-

        REAL*4 X,Y,RESULT,OTS$POWRR
        X = 8.0
        Y = 2.0

C+
C  The arguments of OTS$POWRR are passed by value.
C-

        RESULT = OTS$POWRR(%VAL(X),%VAL(Y))
        TYPE *,' 8.0**2.0 IS ',RESULT
        X = 9.0
        Y = -0.5

C+
C  In FORTRAN, OTS$POWRR is indirectly called by simply
C  using the exponentiation operator.
C-

        RESULT = X**Y
        TYPE *,' 9.0**-0.5 IS ',RESULT
        END
```

This FORTRAN example uses OTS$POWRR to raise an F-floating point base to an F-floating point exponent. The output generated by this program is as follows:

```
 8.0**2.0 IS    64.00000
 9.0**-0.5 IS   0.3333333
```

OTS$SCOPY_DXDX—Copy a Source String Passed by Descriptor to a Destination String

The Copy a Source String Passed by Descriptor to a Destination String routine copies a source string to a destination string. Both strings are passed by descriptor.

Format

OTS$SCOPY_DXDX source-string ,destination-string

corresponding jsb entry point

OTS$SCOPY_DXDX6

Returns

OpenVMS usage	word_unsigned
type	word (unsigned)
access	write only
mechanism	by value

If **source-string** contains more characters than **destination-string**, and the JSB entry point is used, R0 contains the number of characters that were not copied.

Arguments

source-string

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by descriptor

Source string. The **source-string** argument is the address of a descriptor pointing to the source string. The descriptor class can be unspecified, fixed length, dynamic, scalar decimal, array, noncontiguous array, or varying.

destination-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor

Destination string. The **destination-string** argument is the address of a descriptor pointing to the destination string. The class field determines the appropriate action.

See the Description section for further information.

Description

OTS$SCOPY_DXDX copies a source string to a destination string. All error conditions except truncation are signaled; truncation is ignored.

OTS$SCOPY_DXDX passes the source string by descriptor. In addition, an equivalent JSB entry point is provided, with R0 being the first argument (the descriptor of the source string), and R1 the second (the descriptor of the destination string).

For the CALL entry point, R0 (return status) is as it would be after a MOVC5 instruction. For the JSB entry point, R0:R5 and the PSL are as they would be after a MOVC5 instruction. R0:R5 contain the following:

R0	Number of bytes of source string not moved to destination string
R1	Address one byte beyond the last copied byte in the source string
R2	0
R3	Address one byte beyond the destination string
R4	0
R5	0

For further information, see the *VAX Architecture Reference Manual.*

Depending on the class of the destination string, the actions described below occur:

Class Field	Action
DSC$K_CLASS_S,Z,SD,A,NCA	Copy the source string. If needed, space fill or truncate on the right.
DSC$K_CLASS_D	If the area specified by the destination descriptor is large enough to contain the source string, copy the source string and set the new length in the destination descriptor. If the area specified is not large enough, return the previous space allocation (if any) and then dynamically allocate the amount of space needed. Copy the source string and set the new length and address in the destination descriptor.
DSC$K_CLASS_VS	Copy source string to destination string up to the limit of DSC$W_MAXSTRLEN with no padding. Adjust current length field to actual number of bytes copied.

Condition Values Signaled

OTS$_FATINTERR	Fatal internal error.
OTS$_INVSTRDES	Invalid string descriptor.
OTS$_INSVIRMEM	Insufficient virtual memory.

OTS$SCOPY_R_DX—Copy a Source String Passed by Reference to a Destination String

The Copy a Source String Passed by Reference to a Destination String routine copies a source string passed by reference to a destination string.

Format

OTS$SCOPY_R_DX word-int-source-length-val ,source-string-address ,destination-string

corresponding jsb entry point

OTS$SCOPY_R_DX6

Returns

OpenVMS usage	word_unsigned
type	word (unsigned)
access	write only
mechanism	by value

If **source-string-address** contains more characters than **destination-string**, and the JSB entry point is used, R0 contains the number of characters that were not copied.

Arguments

word-int-source-length-val

OpenVMS usage	word_unsigned
type	word (unsigned)
access	read only
mechanism	by value

Length of the source string. The **word-int-source-length-val** argument is an unsigned word integer containing the length of the source string.

source-string-address

OpenVMS usage	char_string
type	character string
access	read only
mechanism	by reference

Source string. The **source-string-address** argument is the address of the source string.

destination-string

OpenVMS usage	char_string
type	character string
access	write only
mechanism	by descriptor

Destination string. The **destination-string** argument is the address of a descriptor pointing to the destination string. The class field determines the appropriate action. The length field (DSC$W_LENGTH) alone or both the

address (DSC$A_POINTER) and length fields can be modified if the string is dynamic. For varying strings, the current length is rewritten.

Description

OTS$SCOPY_R_DX copies a source string to a destination string. All conditions except truncation are signaled; truncation is ignored. Input scalars are passed by value.

OTS$SCOPY_R_DX passes the source string by reference preceded by a length argument. In addition, an equivalent JSB entry point is provided, with R0 being the first argument, R1 the second, and R2 the third, if any. The length argument is passed in bits 15:0 of the appropriate register.

For the CALL entry point, R0 (return status) is as it would be after a MOVC5 instruction. For the JSB entry point, R0:R5 and the PSL are as they would be after a MOVC5 instruction. R0:R5 contain the following:

R0 Number of bytes of source string not moved to destination string

R1 Address one byte beyond the last copied byte in the source string

R2 0

R3 Address one byte beyond the destination string

R4 0

R5 0

For additional information, see the *VAX Architecture Reference Manual.*

Depending on the class of the destination string, the actions described below occur:

Class Field	Action
DSC$K_CLASS_S,Z,SD,A,NCA	Copy the source string. If needed, space fill or truncate on the right.
DSC$K_CLASS_D	If the area specified by the destination descriptor is large enough to contain the source string, copy the source string and set the new length in the destination descriptor. If the area specified is not large enough, return the previous space allocation (if any) and then dynamically allocate the amount of space needed. Copy the source string and set the new length and address in the destination descriptor.
DSC$K_CLASS_VS	Copy source string to destination string up to the limit of DSC$W_MAXSTRLEN with no padding. Adjust current length field to actual number of bytes copied.

Condition Values Signaled

OTS$_FATINTERR	Fatal internal error.
OTS$_INVSTRDES	Invalid string descriptor.
OTS$_INSVIRMEM	Insufficient virtual memory.

Example

A FORTRAN example demonstrating dynamic string manipulation appears at the end of OTS$SGET1_DD. This example uses OTS$SCOPY_R_DX, OTS$SGET1_DD, and OTS$SFREE1_DD.

OTS$SFREE1_DD—Strings, Free One Dynamic

The Free One Dynamic String routine returns one dynamic string area to free storage.

Format

OTS$SFREE1_DD dynamic-descriptor

corresponding jsb entry point

OTS$SFREE1_DD6

Returns

None.

Arguments

dynamic-descriptor

OpenVMS usage	quadword_unsigned
type	quadword (unsigned)
access	modify
mechanism	by reference

Dynamic string descriptor. The **dynamic-descriptor** argument is the address of the dynamic string descriptor. The descriptor is assumed to be dynamic and its class field is not checked.

Description

OTS$SFREE1_DD deallocates the described string space and flags the descriptor as describing no string at all (DSC$A_POINTER = 0 and DSC$W_LENGTH = 0).

Condition Value Signaled

OTS$_FATINTERR	Fatal internal error.

Example

A FORTRAN example demonstrating dynamic string manipulation appears at the end of OTS$SGET1_DD. This example uses OTS$SFREE1_DD, OTS$SGET1_DD, and OTS$SCOPY_R_DX.

OTS$SFREEn_DD—Strings, Free n Dynamic

The Free *n* Dynamic Strings routine takes as input a vector of one or more dynamic string areas and returns them to free storage.

Format

OTS$SFREEN_DD descriptor-count-value ,first-descriptor

corresponding jsb entry point

OTS$SFREEN_DD6

Returns

None.

Arguments

descriptor-count-value

OpenVMS usage	longword_unsigned
type	longword (unsigned)
access	read only
mechanism	by value

Number of adjacent descriptors to be flagged as having no allocated area (DSC$A_POINTER = 0 and DSC$W_LENGTH = 0) and to have their allocated areas returned to free storage by OTS$SFREEN_DD. The **descriptor-count-value** argument is an unsigned longword containing this number.

first-descriptor

OpenVMS usage	quadword_unsigned
type	quadword (unsigned)
access	modify
mechanism	by reference

First string descriptor of an array of string descriptors. The **first-descriptor** argument is the address of the first string descriptor. The descriptors are assumed to be dynamic, and their class fields are not checked.

Description

OTS$SFREEN_DD6 deallocates the described string space and flags each descriptor as describing no string at all (DSC$A_POINTER = 0 and DSC$W_LENGTH = 0).

Condition Values Signaled

OTS$_FATINTERR	Fatal internal error.

OTS$SGET1_DD—Strings, Get One Dynamic

The Get One Dynamic String routine allocates a specified number of bytes of dynamic virtual memory to a specified string descriptor.

Format

OTS$SGET1_DD word-integer-length-value ,dynamic-descriptor

corresponding jsb entry point

OTS$SGET1_DD_R6

Returns

None.

Arguments

word-integer-length-value

OpenVMS usage	word_unsigned
type	word (unsigned)
access	read only
mechanism	by value

Number of bytes to be allocated. The **word-integer-length-value** argument contains the number of bytes. The amount of storage allocated is automatically rounded up. If the number of bytes is zero, a small number of bytes is allocated.

dynamic-descriptor

OpenVMS usage	quadword_unsigned
type	quadword (unsigned)
access	modify
mechanism	by reference

Dynamic string descriptor to which the area is to be allocated. The **dyn-str** argument is the address of the dynamic string descriptor. The class field is not checked but it is set to dynamic (DSC$B_CLASS = 2). The length field (DSC$W_LENGTH) is set to **word-integer-length-value** and the address field (DSC$A_POINTER) is set to the string area allocated (first byte beyond the header).

Description

OTS$SGET1_DD allocates a specified number of bytes of dynamic virtual memory to a specified string descriptor. This routine is identical to OTS$SCOPY_DXDX except that no source string is copied. You can write anything you want in the allocated area.

If the specified string descriptor already has dynamic memory allocated to it, but the amount allocated is either greater than or less than **word-integer-length-value**, that space is deallocated before OTS$SGET1_DD allocates new space.

Condition Values Signaled

OTS$_FATINTERR	Fatal internal error.
OTS$_INSVIRMEM	Insufficient virtual memory.

Example

```
        PROGRAM STRING_TEST

C+
C       This program demonstrates the use of some dynamic string
C       manipulation routines.
C-

C+
C       DECLARATIONS
C-

        IMPLICIT NONE
        CHARACTER*80    DATA_LINE
        INTEGER*4       DATA_LEN, DSC(2), CRLF_DSC(2), TEMP_DSC(2)
        CHARACTER*2     CRLF

C+
C       Initialize the output descriptor.  It should be empty.
C-

        CALL OTS$SGET1_DD(%VAL(0), DSC)

C+
C       Initialize a descriptor to the string CRLF and copy the
C       character CRLF to it.
C-

        CALL OTS$SGET1_DD(%VAL(2), CRLF_DSC)
        CRLF = CHAR(13)//CHAR(10)
        CALL OTS$SCOPY_R_DX( %VAL(2), %REF(CRLF(1:1)), CRLF_DSC)

C+
C       Initialize a temporary descriptor.
C-

        CALL OTS$SGET1_DD(%VAL(0), TEMP_DSC)

C+
C       Prompt the user.
C-

        WRITE(6, 999)
999     FORMAT(1X, 'Enter your message, end with Ctrl/Z.')

C+
C       Read lines of text from the terminal until end-of-file.
C       Concatenate each line to the previous input.  Include a
C       CRLF between each line.
C-

        DO WHILE (.TRUE.)
            READ(5, 998, ERR = 10) DATA_LEN, DATA_LINE
998         FORMAT(Q,A)
            CALL OTS$SCOPY_R_DX( %VAL(DATA_LEN),
     1          %REF(DATA_LINE(1:1)),
     2          TEMP_DSC)
            CALL STR$CONCAT( DSC, DSC, TEMP_DSC, CRLF_DSC )
        END DO
```

```
C+
C       The user has typed Ctrl/Z.  Output the data we read.
C-
10      CALL LIB$PUT_OUTPUT( DSC )
C+
C       Free the storage allocated to the dynamic strings.
C-
        CALL OTS$SFREE1_DD( DSC )
        CALL OTS$SFREE1_DD( CRLF_DSC )
        CALL OTS$SFREE1_DD( TEMP_DSC )
C+
C       End of program.
C-
        STOP
        END
```

This FORTRAN example program demonstrates dynamic string manipulation using OTS$SGET1_DD, OTS$SFREE1_DD, and OTS$SCOPY_R_DX.

How to Order Additional Documentation

Technical Support

If you need help deciding which documentation best meets your needs, call 800-DIGITAL (800-344-4825) and press 2 for technical assistance.

Electronic Orders

If you wish to place an order through your account at the Electronic Store, dial 800-234-1998, using a modem set to 2400- or 9600-baud. You must be using a VT terminal or terminal emulator set at 8 bits, no parity. If you need assistance using the Electronic Store, call 800-DIGITAL (800-344-4825) and ask for an Electronic Store specialist.
