1.0 ABSTRACT

The exerciser will be similar to that of other disk subsystem exercisers. Writes will be performed to the disks followed by read and compare of the data read. The controller will do all error retrying. Errors will be reported on the console TTY.

All desired disk drives on the controller will be exercised simultaneously. If disk accessing is not required, then data written will go only as far as the controller's RAM memory.

If the results of the exerciser requires more information, two other PDP-11 diagnostic programs are available. They are:

CZUDHA0 - UDA50A/KDA50-Q and Disk Drive Diagnostic
CZUDIA0 - UDA50A/KDA50-Q Disk Drive Exerciser
CZUDKA0 - UDA50A/KDA50-Q Disk Formatter.

2.0 REQUIREMENTS

Hardware for all cases:

One DEC/X11 module configures for one UDA50A or KDA50-Q

controller.

Hardware for disk accessing:

One controller with at least one drive is the minimum amount or one controller with four drives is the maximum amount.

Hardware for no disk accessing:

One controller is the only requirement.

Storage: DUBD requires

Decimal words -- 4096 MAX

3.0 START-UP

On the initial start, the program will clear bit1 of 'SR1' and type the following messages.

DUBDO PA:0060162 APC: 000674 PASS #00000

'IF YOU WISH TO DESTROY CUSTOMER DATA, SET BIT1 (NOT BIT0) IN SWITCH REGISTER 1(SR1) OF DUBD? EQUAL TO 1.'

DUBDO PA:0060210 APC: 000722 PASS #00000
 '! OPERATING WITH NO DISK ACCESSING !'

This will occur regardless of the condition of SR1 (bit1) at configure time.

If the operator wishes to exercise the drive, SR1 (bit1) must be modified at location 16 of CXDUBDO module (see section 9). This can be accomplished by using the 'MOD' command supplied by the DECX11 run time system. Unless the program is reloaded or the operator modifies the location again, the contents of SR1 will remain the same on all subsequent starts.

On all subsequent starts, the condition of SR1 (bit1) will type to terminal in the following manner.

If bit1 of SR1 is equal to 0 (zero), the following warning will be typed.

DUBDO PA:0060210 APC: 000722 PASS #00000
 '! OPERATING WITH NO DISK ACCESSING !'

If bit1 of SR1 is equal to 1 (one), the following warning will be typed.

DUBDO PA:0060210 APC: 000722 PASS #00000
 '! CUSTOMER DATA WILL BE DESTROYED !'

<<<< NOTE >>>>

When this DEC/X11 module runs in diskless mode, its data rate exceeds all other devices. This may cause erroneous data lates from other devices.

4.0 PASS DEFINITION

One pass of the DUBD module consists of 512 iterations of the basic test sequence (write, read, data-check). The test sequence writes a user defined number of words (default is 256) words, reads 256 words, and data-compare same.

5.0 EXECUTION TIME

The default execution time of one pass of DUBD running alone on a PDP-11/44 under sequential disk accessing mode will be approximately 20 seconds. Under random accessing mode, the time is 40 seconds. For no disk accessing, the time is five seconds

6.0 CONFIGURATION REQUIREMENTS

Default Parameters:

DEVADR: 172150, VECTOR: 154, BR1: 4, DEVCNT: 1, SR1:
0, SR2: 0

REQUIRED PARAMETERS:

Additional controller module(s) configured must have different Unibus address(es) and vector(s).

7.0 DEVICE/OPTION SETUP

For disk mode, make certain that all units are powered up, write enabled, connected to a controller via the SDI and ready.

For diskless mode, make certain the controller is powered up.

8.0 MODULE OPERATION

TEST SEQUENCE DISK MODE:

- A. Setup device register addresses and module variables.
Set controller characteristic.
- B. Reset all units on-line and drop all that are not.

- C. Get a unit address.
- D. Get a disk address and a fresh block of data.
- E. Do a write -- if errors, report.
- F. Do a read -- if errors, report.
- G. Do a data-check -- if errors, report and continue.
- H. Make unit available.
- I. Wait for available attention message.
- J. If end of pass, report and go to D.
- K. If end of testing unit, go to C; else go to D.

Blocks determined defective won't be replaced by the exerciser during this sequence. The exerciser makes full use of the controller which does revectoring on its own.

TEST SEQUENCE DISKLESS MODE:

- A. Get a fresh block of data.
- B. Do a write to controller RAM buffer -- if errors, report.
- C. Do a read from controller RAM buffer -- if errors, report.
- D. Do a data-check -- if errors, report and continue.
- E. If end of pass, report.
- F. Go to A.

9.0 OPERATION OPTIONS

One or more software switch registers can be used by the module program general purpose switches. These words are used to define or specify a unique device option or to point to a specific routine in the module. Any option must be specified by the operator before the module is run. Switch Register 1 has the following characteristics.

- SR1 Bit 1 set (1): Allow disk transfers.
 <<<< NOTE >>>> IF SET, CUSTOMER DATA WILL BE DESTROYED!
 reset (0): No disk transfers.
- SR1 Bit 2 set (1): Do not report errors as they occur.
 reset (0): Report errors as they occur.
- SR1 Bit 3 set (1): Do not print error summary at end of pass.
 reset (0): Print error summary at end of pass.
- SR1 Bit 9 set (1): Run Dual port mode (only valid if SR1 Bit 1 is set)
 reset (0): Do not run Dual port mode
- SR1 Bit 10 set (1): Select random block addressing.(only valid if SR1 Bit 1 is set)
 reset (0): Select sequential block

addressing.

SR1 Bit 11 set (1): Bypass data compare.
 reset (0): Do data compare.

Switch register 2 has the following characteristics.

SR2 Bits 0 to 5: Burst rate.

A burst rate to speed up NPR transfers by the controller can be used. This value is 6 bits maximum and set up in SR2 at configure time.

<<<< NOTE >>>>

The DVID1 mask reflects the number of units chosen for testing and which units on the system are to be tested. Example: If DVID1 contains a 1, only the first unit found on the system will be tested. A unit's order on the system is judged by its unit number. The lowest unit number zero (0). Unit 0 would be the first tested on the system.

If DVID1 contains a 10, the fourth unit on the system will be tested. If the first two units are chosen, DVID1 is 3. Four consecutive units means DVID1 is 17. Six units, DVID1 is 77.

If there is not a unit corresponding to the DVID1 bit setting, the bit set in DVID1 gets cleared. The exerciser will readjust the mask and drop the nonexistent units if more units are chosen than actually are present. The module is dropped if all DVID1 bits are cleared.

If the number of units chosen is less than the actual number of units present, only the desired units will be used during the exercise.

<<<< ANOTHER NOTE >>>>

Make sure all subunit drives are accounted for. Destroying customer data is not desirable.

<<<< ONE MORE NOTE >>>>

If SR1 Bit 3 is reset, a summary status is printed every 15 passes. This status is formatted as follows:

DUBDO PA: 00060470 ACP: 001210 PASS #00000

SOFT ERROR COUNT #00000 *** HARD ERROR COUNT #00000
 CHECK DATA ERROR COUNT #00000

A. Most printouts have the standard formats described in the DEC/X11 document.

B. Non-standard printouts include error messages which dump the following:

- 1) Summary status
- 2) Flags and endcode
- 3) Unit number
- 4) Byte count
- 5) Hi 16-bit LBN value
- 6) Lo 16-bit LBN value
- 7) Extended address
- 8) Physical address

All values except for PASS, RUNTIME and ERRCNT are printed in octal. PASS, RUNTIME and ERRCNT are printed in decimal.
 Example:

DUBDO PA: 00064116 APC: 004630 PASS: 00000 ERRCNT: 00001
 CSRA: 172150 CSRC: 000000 ASTAT: 000006 ERRTYP: 000006
 RUNTIME: 000:00:22

DUBDO PA: 00064052 APC: 004564 PASS: 00000

STATUS ENDCOD UNITNU BYTECO HI LBN LO LBN EXTADR PHYADR
 000006 000242 000005 000000 000003 116321 000001 062100

STATUS - response of the command sent to the controller. This is contained in the last five bits of the word. Here is a list of status codes.

- 0 - success
- 1 - invalid command
- 2 - command aborted
- 3 - unit offline
- 4 - unit available
- 5 - media error
- 6 - write protected
- 7 - compare error
- 10 - data error
- 11 - host buffer access error
- 12 - controller error
- 13 - drive error

ENDCOD - ending code of the command sent. This shows what command was sent to the UDA. Here is a list of all possible endcodes this module uses.

- 100 - AVAILABLE ATTENTION MESSAGE (not a command but a message sent to the host from the UDA)
- 200 - INVALID COMMAND
- 203 - GET UNIT STATUS
- 204 - SET CONTROLLER CHARACTERISTICS
- 210 - AVAILABLE
- 211 - ONLINE

230 - MAINTENANCE READ
 231 - MAINTENANCE WRITE
 241 - READ
 242 - WRITE

UNITNU - unit number of the drive that is being accessed.
 This is not relevant if the user is running diskless mode.

BYTECO - size of the buffer in bytes.

HI LBN - high logical block number (upper 16 bits) which tells the user where on the disk the data is going. This is only valid for disk mode.

LO LBN - low logical block number (lower 16 bits).

EXTADR - extended address of the read/write buffer.

PHYADR - physical address of the read/write buffer.

C. If the controller failed to pass its internal diagnostic, one of the following messages will be printed.

If the diagnostic found a fault:

DUBDO PA: 00062052 APC: 002564 PASS: 00000
 CONTROLLER INIT ERROR, FOUND BY DIAGNOSTIC
 SA REGISTER = xxxxxx IN STEP yyyyy
 ADDR = zzzzzz

If a step bit was not set as expected during the initialization sequence of the controller:

DUBDO PA: 00062152 APC: 002664 PASS: 00000
 CONTROLLER INIT ERROR, STEP NOT SET
 SA REGISTER = xxxxxx IN STEP yyyyy
 ADDR = zzzzzz

If data passed back from the controller was not equal to the expected value:

DUBDO PA: 00062252 APC: 002764 PASS: 00000
 CONTROLLER INIT ERROR, EXPECTED DATA WAS INCORRECT
 SA REGISTER = xxxxxx IN STEP yyyyy
 ADDR = zzzzzz

Where xxxxxx can have any of the following values and meanings:

104000 - Fatal sequencer error
 104040 - D processor ALU error
 104041 - D proc ROM parity error
 105102 - D proc with no Board #2 or RAM parity error
 105105 - D proc RAM buffer error
 105152 - D proc SDI error
 105153 - D proc write mode wrap SERDES error

105154 - D proc read mode SERDES, RSGEN, and ECC error
 106040 - U proc ALU error
 106041 - U proc Control Register error
 106042 - U proc DFAIL/ROM parity error/Board #1 test count is wrong
 106047 - U proc Constant ROM error with D proc running SDI test
 106055 - Unexpected trap found, aborted diagnostic
 106071 - U proc ROM error
 106072 - U proc ROM parity error
 106200 - Step 1 data error (MSB not set)
 107103 - U proc RAM parity error
 107107 - U proc RAM buffer error
 107115 - Board #2 test count was wrong
 112300 - Step 2 error
 122240 - NPR error
 122300 - Step 3 error
 142300 - Step 4 error

Where yyyyy is the step in which the error was found.

Where zzzzz is the address of the UDA.

If the maximum number of retries has been exceeded, the following message will be printed.

DUBDO PA: 00061414 APC:002126 PASS #00000

RETRY COUNT EXCEEDED, ABORT

This means the controller did not successfully complete the initialization in four passes. The module is then dropped.

D. If the UDA did not successfully clear the ring buffer in the host area, the following message will be printed.

DUBDO PA: 00061414 APC:002126 PASS #00000

RING AREA NOT CLEARED

This is a fatal error. It means that the controller did not access host memory that the controller would use to communicate with the host. The module is then dropped.

E. If the SAregister displays a non-zero value after the initialization sequence is done, the following message will be printed.

DUBDO PA: 00064252 APC: 004764 PASS: 00000

SA REGISTER IS NOT ZERO, = xxxxxx
 CONTROLLER IS GOING THROUGH INITIALIZATION

Where xxxxxx can have the following values and meanings.

004400 - controller has been initied by either a bus init or by writing into the IP register.
 100001 - bus envelope/packet read error (parity or timeout)

100002 - bus envelopepacket write error (parity or timeout)
 100003 - controller ROM and RAM parity error
 100004 - controller RAM parity error
 100005 - controller ROM parity error
 100006 - bus ring read error
 100007 - bus ring write error
 100010 - bus interrupt master failure
 100011 - Host access timeout error
 100012 - Host exceeded credit limit
 100013 - controller SDI hardware fatal error
 100014 - DM XFC fatal error
 100015 - Hardware timeout of instruction loop
 100016 - Invalid virtual circuit identifier
 100017 - Interrupt write error on bus

E. If a drive is dropped by the exerciser, one of the following messages will be printed.

If the drive had an error it could not handle properly after an iteration, the following message will be printed:

DUBDO PA: 00063012 APC: 003524 PASS #00000

DRIVE 00000 DROPPED.
 DEVICE ID BIT = 000001
 ERRORS CAUSED DRIVE TO BE DROPPED

If the drive was not found by the exerciser, the following message will be printed:

DUBDO PA: 00063012 APC: 003524 PASS #00000

DRIVE 00000 DROPPED.
 DEVICE ID BIT = 000001
 UNIT WAS NOT FOUND BY THE EXERCISER

If there were more device count bits set than the actual number of drives found, the following message will be printed:

DUBDO PA: 00063012 APC: 003524 PASS #00000

DRIVE 00000 DROPPED.
 DEVICE ID BIT = 000001
 DVID₁ BIT SET HIGHER THAN ACTUAL # OF DRIVES FOUND

Solution: try a lesser number of units in DVID1 (loc 14)

11.0 DUAL PORT OPERATION

To run a dual port operation, set bit9 of SR1. The exerciser will check the unit to see if it is offline or available.

The controller will retain control of a unit until the MSCP Available command is entered by the host. During this time, the other controller is not allowed access to the unit through the other port between the write and read. The other controller senses when the unit becomes available and takes it. The MSCP Available command is only executed if SR1 bit 9 and SR1 bit 1 are set. This allows dual porting and disk accessing respectively.

DEC/X11 will only dual port a drive with another DEC/X11 exerciser.

12.0 GLOSSARY

DUBD follows the module name format described in the DEC/X11 Programmer's Guide.

- DU-- Identifies the hardware and thus the module.
- B- Distinguishes between two or more different modules for the same generic device. The sequence A, B, C, ETC. must be used for each additional example.
- D Specifies the module revision.

IOMODX is a type of module in an extended input/output mode. These modules are interrupt driven and are capable of input/output operation. Some added capabilities provided include:

- ⓐ Use of monitor supplied write buffers.
- ⓐ Ability to change the size of the write buffers.
- ⓐ Access to the monitor's check data utility.
- ⓐ Conversion routines to get 18 bit addresses from 16 bit addresses.
