The main body of the document is a large, dense grid of data. Each cell in the grid contains a small table or set of data points, likely representing a detailed technical specification or a data matrix. The text is too small to be legible in this view, but the overall structure is a regular grid of approximately 15 columns and 25 rows of data blocks.

1.0 GENERAL INFORMATION

1.1 PROGRAM ABSTRACT

This program will format any disk drive connected to a UDA-50 disk controller. There are three ways to format a disk with this program:

1. Reformat - Format the disk with the bad sector information that was written onto the disk at the factory. This is the normal way to format a disk.
2. Reconstruct - Format the disk without using any bad sector information. This should be used only when the bad sector information has been destroyed or for some reason can no longer be read from the disk. This method may also be specified in the disk drive's maintenance manual for special cases (eg. changing an RM/RA80 spare HDA from RM80 format to RA80 format).
3. Restore - Format the disk using bad sector information obtained from a disk file on the XXDP+ system load device. This method is provided for use by manufacturing. No files are provided, nor any method of obtaining the files, at this time.

The format operation is performed by a Diagnostic Utilities and Protocol (DUP) program loaded into the UDA-50 disk controller. The host program simply downline loads the DUP program in the UDA-50 and monitors its execution. The DUP program obtains parameters from the host program (eg. drive number and format mode) and requests the host program to print error and summary messages. The DUP program is also commonly called a "diagnostic machine" (DM) program.

This program can only format in one mode at a time. In RESTORE mode, only one disk may be selected in the hardware questions or an error message will result and the program will stop.

In REFORMAT and RECONSTRUCT modes, any number of disk drives may be selected. A UDA-50 can only format one disk at a time, so each disk on a UDA-50 will be selected sequentially. If the disk drives to be formatted are connected to different UDA-50s, all UDA-50s will be run simultaneously. For example, lets assume three units are selected for formatting in the hardware questions, units 1 and 2 are connected to one UDA-50 and unit 3 is connected to a different UDA-50 (Unibus addresses are different). This program will automatically start simultaneous format operations on units 1 and 3. When unit 1 finishes (or errors), unit 2 will be started. After units 2 and 3 are finished, the program stops.

This program will stop after each pass (all units formatted once). There is no need to specify a PASS switch on the command line to the Diagnostic Runtime Services (eg. START/PASS:1).

Special provisions have been made to allow this program to run under an APT system in manufacturing. This system does not allow questions to be asked of an operator. Such a condition also exists under XXDP+ when the UAM flag is set. In this condition, only reformat mode can be selected. Selecting RECONSTRUCT or RESTORE will result in an error. Also, a date of 1-JAN-70 will be written on the disk.

1.2 SYSTEM REQUIREMENTS

This program was designed using the PDP-11 Diagnostic Runtime Services revision C. Run time environments are determined by the Runtime Services and may change as new versions of the Services are developed. The initial version will require the following:

- PDP-11 Unibus processor
- 28K words of memory (minimum)
- Console terminal
- XXDP+ load media containing this program
- One or more UDA-50 subsystems

A system clock - either type L or P - will be used to time the DUP program and report runtime, if available. If no system clock is available, this program cannot detect a hung DUP program.

2.0 OPERATING INSTRUCTIONS

This section contains a brief description of the Runtime Services. For detailed information, refer to the XXDP+ User's Manual (CHQUS).

2.1 COMMANDS

There are eleven legal commands for the Diagnostic Runtime Services (Supervisor). This section lists the commands and gives a very brief description of them. The XXDP+ User's Manual has more details.

COMMAND	EFFECT
START	Start the diagnostic from an initial state
RESTART	Start the diagnostic without initializing
CONTINUE	Continue at test that was interrupted (after ^C)
PROCEED	Continue from an error halt
EXIT	Return to XXDP+ Monitor (XXDP+ OPERATION ONLY!)
ADD	Activate a unit for testing (all units are considered to be active at start time)
DROP	Deactivate a unit
PRINT	Print statistical information (see section 4.0)

DISPLAY	Type a list of all device information
FLAGS	Type the state of all flags (see section 2.3)
ZFLAGS	Clear all flags (see section 2.3)

A command can be recognized by the first three characters. So you may, for example, type "STA" instead of "START".

2.2 SWITCHES -----

There are several switches which are used to modify supervisor operation. These switches are appended to the legal commands. All of the legal switches are tabulated below with a brief description of each. In the descriptions below, a decimal number is designated by "DDDDD".

SWITCH -----	EFFECT -----
/TESTS:LIST	Execute only those tests specified in the list. List is a string of test numbers, for example - /TESTS:1:5:7-10. This list will cause tests 1,5,7,8,9,10 to be run. All other tests will not be run.
/PASS:DDDDD	Execute DDDDD passes (DDDDD = 1 to 64000)
/FLAGS:FLGS	Set specified flags. Flags are described in section 2.3.
/EOP:DDDDD	Report end of pass message after every DDDDD passes only. (DDDDD = 1 to 64000)
/UNITS:LIST	TEST/ADD/DROP only those units specified in the list. List example - /UNITS:0:5:10-12 use units 0,5,10,11,12 (unit numbers = 0-63).

Example of switch usage:

START/TESTS:1-5/PASS:1000/EOP:100

The effect of this command will be: 1) tests 1 through 5 will be executed, 2) all units will tested 1000 times and 3) the end of pass messages will be printed after each 100 passes only. A switch can be recognized by the first three characters. You may, for example, type "/TES:1-5" instead of "/TESTS:1-5".

Below is a table that specifies which switches can be used by each command.

	TESTS	PASS	FLAGS	EOP	UNITS
START	X	X	X	X	X
RESTART	X	X	X	X	X
CONTINUE		X	X	X	
PROCEED			X		
DROP					X
ADD					X
PRINT					
DISPLAY					X
FLAGS					
ZFLAGS					
EXIT					

2.3 FLAGS

Flags are used to set up certain operational parameters such as looping on error. All flags are cleared at startup and remain cleared until explicitly set using the flags switch. Flags are also cleared after a START or RESTART command unless set using the flag switch. The ZFLAGS command may also be used to clear all flags. With the exception of the START, RESTART and ZFLAGS commands, no commands affect the state of the flags; they remain set or cleared as specified by the last flag switch.

FLAG	EFFECT
HOE	Halt on error - control is returned to runtime services command mode
LOE	Loop on error
IER*	Inhibit all error reports
IBE*	Inhibit all error reports except first level (first level contains error type, number, PC, test and unit)
IXE*	Inhibit extended error reports (those called by PRINTX macro's)
PRI	Direct messages to line printer
PNT	Print test number as test executes
BOE	'BELL' on error
JAM	Unattended mode (no manual intervention)
IDU	Inhibit program dropping of units
LOT	Loop on test

*Error messages are described in section 3.1

See the XXDP+ User's Manual for more details on flags. You may specify more than one flag with the FLAG switch. For example, to cause the program to loop on error, inhibit error reports and type a 'BELL' on error, you may use the following string:

/FLAGS:LOE:IER:BOE

2.4 HARDWARE QUESTIONS

When a diagnostic is STARTed, the Runtime Services will prompt the user for hardware information by typing "CHANGE HW (L) ?". When you answer this question with a "Y", the Runtime Services will ask for the number of units (in decimal). You will then be asked the following questions for each unit. When you answer this question with an "N", the Runtime Services will use the answers built into the program by the SETUP utility (see chapter 6 of the XXDP+ User's Manual). If you have never run the SETUP utility on this program file, the default values listed below (just before the question mark) will be used.

UNIBUS ADDRESS OF UDA (O) 172150 ?

Answer with the address of the UDAIP register of one UDA as addressed by the processor with memory management turned off (i.e., an even 16-bit address in the range of 160000 to 177774).

VECTOR (O) 154 ?

Answer with the interrupt vector address of the UDA. A vector address in the range of 4 to 774 may be specified. The UDA does not have a vector "hard wired" to it, so any vector not being used by this program and XXDP+ may be used.

BR LEVEL (D) 5 ?

Answer with the interrupt priority used by the UDA. Levels 4 to 7 are accepted. This level must match the level "hard wired" in the UDA by the priority plug.

UNIBUS BURST RATE (D) 63 ?

The UDA allows the ability to control the maximum number of words transferred across the UNIBUS each time the UDA becomes master. The default answer of 63 will allow for the fastest execution of this diagnostic program. You may answer with the value your operating system uses or use zero which will tell the UDA to supply a value that should work on any system. A decimal number in the range of 0 to 63 may be specified and all values should work on any system. A larger value will allow for a faster running program. The value will be passed directly to the UDA during initialization.

DRIVE NUMBER (D) 0 ?

Answer with the drive number of the drive you wish to test. This is the number which appears on the "unit plug" on the front of the disk drive. On a multi-unit drive, each sub-unit number on the drive must be tested as a separate unit to completely test the drive. A maximum of eight logical drives may be tested on one UDA at a time (UDA configuration limit).

2.5 SOFTWARE QUESTIONS

After you have answered the hardware questions or after a RESTART or CONTINUE command, the Runtime Services will ask for software parameters. You will be prompted by "CHANGE SW (L) ?" If you wish to change any parameters, answer by typing "Y". The software questions and the default values are described in the next paragraphs. You may change the default values with the SETUP utility.

REFORMAT USING EXISTING BAD SECTOR INFORMATION (L) Y ?

If this question is answered "YES", then the user wants the REFORMAT mode format operation. REFORMAT mode will use the bad sector information that is already on the disk. Any other mode will destroy this information. If this question is answered "NO", the following will be asked to be sure the user knows what he is doing.

NOT USING EXISTING INFORMATION WILL DESTROY THE FACTORY BAD SECTOR INFORMATION ON THE DISK.
AGAIN - REFORMAT USING EXISTING BAD SECTOR INFORMATION (L) Y ?

This is asked to verify that the user does want to destroy the bad sector information on the disk and run another format mode. If this is answered "YES", then the user wants the REFORMAT mode format operation and use the existing bad block information. If again answered "NO", the following question will be asked.

RECONSTRUCT BAD SECTOR INFORMATION (L) Y ?

A "YES" answer will cause a reconstruct mode format operation. If answered "NO", the following will be asked to verify the user really wants the restore mode format.

DO YOU HAVE A FILE ON THE SYSTEM LOAD DEVICE
CONTAINING BAD SECTOR INFORMATION (L) N ?

Note that such a file will not be provided with the diagnostic and this mode is not recommended. The format will begin only on a "YES" answer. Otherwise the following message will be printed and the program will abort.

YOU CANNOT PROCEED WITHOUT SUCH A FILE.
RESTART PROGRAM AND SELECT TO REFORMAT OR RECONSTRUCT DISK.

2.6 MANUAL INTERVENTION QUESTIONS

Once the program is started, the date will be asked for in the format used by the XXDP+ system.

ENTER DATE AS DD-MMM-YY (A) 1-JAN-70 :

The default is provided so the user need not supply the date. The date question will normally only be asked one time. If an improper answer is typed, "INPUT ERROR" is printed and the question is asked again. A two or four digit year may be typed. A four digit year must be 1900 or greater (eg. 14-APR-1982). If only two digits are typed, the year is determined as follows:

1. If the number typed is 70 or greater, a 19 is prefixed. Eg., 1-JAN-70 translates to year 1970 and 25-DEC-99 translates to year 1999.
2. If the number typed is less than 70, a 20 is prefixed. Eg., 1-APR-21 is translated to year 2021.

If RECONSTRUCT mode is selected, the following question will be asked for each disk of be formatted before the format operation begins.

SERIAL NUMBER FOR UNIT xx UDA AT xxxxxx DRIVE xxx
(A) ?

A decimal number in the range of 0 to 18446744073709551615 must be entered (no default).

If RESTORE mode is selected, the following question will be asked.

NAME OF FILE CONTAINING BAD SECTOR INFORMATION FOR
DISK TO BE FORMATTED (A) ?

If the file named does not exist on the system load device, the program will abort back to the XXDP+ prompt after printing an error message.

2.7 EXTENDED P-TABLE DIALOGUE

When you answer the hardware questions, you are building entries in a table that describes the devices under test. The simplest way to build this table is to answer all questions for each unit to be tested. If you have a multiplexed device such as a mass storage controller with several drives or a communication device with several lines, this becomes tedious since most of the answers are repetitious.

To illustrate a more efficient method, suppose you are testing a fictional device, the XY11. Suppose this device consists of a control module with eight units (sub-devices) attached to it. These units are described by the octal numbers 0 through 7. There is one hardware parameter that can vary among units called the Q-factor. This Q-factor may be 0 or 1. Below is a simple way to build a table for one XY11 with eight units.

```
# UNITS (D) ? 8<CR>
```

```
UNIT 1  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 0<CR>  
Q-FACTOR (O) 0 ? 1<CR>
```

```
UNIT 2  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 1<CR>  
Q-FACTOR (O) 1 ? 0<CR>
```

```
UNIT 3  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 2<CR>  
Q-FACTOR (O) 0 ? <CR>
```

```
UNIT 4  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 3<CR>  
Q-FACTOR (O) 0 ? <CR>
```

```
UNIT 5  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 4<CR>  
Q-FACTOR (O) 0 ? <CR>
```

```
UNIT 6  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 5<CR>  
Q-FACTOR (O) 0 ? <CR>
```

```
UNIT 7  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 6<CR>  
Q-FACTOR (O) 0 ? 1<CR>
```

```
UNIT 8  
CSR ADDRESS (O) 160000<CR>  
SUB-DEVICE # (O) ? 7<CR>  
Q-FACTOR (O) 1 ? <CR>
```

Notice that the default value for the Q-factor changes when a non-default response is given. Be careful when specifying multiple units!

As you can see from the above example, the hardware parameters do not vary significantly from unit to unit. The procedure shown is not very efficient.

The Runtime Services can take multiple unit specifications however.
Let's build the same table using the multiple specification feature.

```
# UNITS (D) ? 8<CR>
```

```
UNIT 1  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 0,1<CR>  
Q-FACTOR (O) 0 ? 1,0<CR>
```

```
UNIT 3  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 2-5<CR>  
Q-FACTOR (O) 0 ? 0<CR>
```

```
UNIT 7  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 6,7<CR>  
Q-FACTOR (O) 0 ? 1<CR>
```

As you can see in the above dialogue, the runtime services will build as many entries as it can with the information given in any one pass through the questions. In the first pass, two entries are built since two sub-devices and q-factors were specified. The Services assume that the CSR address is 160000 for both since it was specified only once. In the second pass, four entries were built. This is because four sub-devices were specified. The "-" construct tells the Runtime Services to increment the data from the first number to the second. In this case, sub-devices 2, 3, 4 and 5 were specified. (If the sub-device were specified by addresses, the increment would be by 2 since addresses must be on an even boundary.) The CSR addresses and Q-factors for the four entries are assumed to be 160000 and 0 respectively since they were only specified once. The last two units are specified in the third pass.

The whole process could have been accomplished in one pass as shown below.

```
# UNITS (D) ? 8<CR>
```

```
UNIT 1  
CSR ADDRESS (O) ? 160000<CR>  
SUB-DEVICE # (O) ? 0-7<CR>  
Q-FACTOR (O) 0 ? 0,1,0,,,,1,1<CR>
```

As you can see from this example, null replies (commas enclosing a null field) tell the Runtime Services to repeat the last reply.

2.8 QUICK START-UP PROCEDURE

To start-up this program:

1. Boot XXDP+
2. Give the date and answer the LSI and 50HZ (if there is a clock) questions
3. Type 'R ZUDEBO'
4. Type "START"
5. Answer the "CHANGE HW" question with "Y"
6. Answer all the hardware questions
7. Answer the "CHANGE SW" question with "N"

When you follow this procedure you will be using only the defaults for flags and software parameters. These defaults are described in sections 2.3 and 2.5.

Sample of terminal dialogue to test two disks on one UDA-50:

DR>STA

3.0 ERROR INFORMATION

3.1 TYPES OF ERROR MESSAGES

There are three levels of error messages that may be issued by a diagnostic: general, basic and extended. General error messages are always printed unless the "IER" flag is set (section 2.3). The general error message is of the form:

```
NAME TYPE NUMBER ON UNIT NUMBER TST NUMBER PC:XXXXXX  
error message
```

where: NAME = diagnostic name
TYPE = error type (SYS FTL ERR, DEV FTL ERR)
NUMBER = error number
UNIT NUMBER = 0 - N (N is last unit in PTABLE)
TST NUMBER = test and subtest where error occurred
PC:XXXXXX = address of error message call

System fatal errors (SYS FTL ERR) are used to report errors that are fatal to the entire diagnostic program. The diagnostic stops and the Runtime Services prompt is printed.

Device fatal errors (DVC FTL ERR) are used to report errors that are fatal to the device (may be either a UDA-50 or disk drive). Testing stops on that device for the remainder of the current test.

Basic error messages are messages that contain some additional information about the error. These are always printed unless the "IER" or "IBE" flags are set (section 2.3). These messages are printed after the associated general message.

Extended error messages contain supplementary error information such as register contents or good/bad data. These are always printed unless the "IER", "IBE" or "IXE" flags are set (section 2.3). These messages are printed after the associated general error message and any associated basic error messages.

The general and basic error messages from this diagnostic are always one line each. The basic message defines what program detected the error, the UDA-50 being used and the time of the error:

```
HOST PROGRAM UDA AT xxxxxx RUNTIME hhh:mm:ss
```

The host program (PDP-11) detected the error. UDA AT xxxxx identifies the address of the UDA-50 being tested. It may be omitted if the error is not specific to one UDA-50.

Sample error message:

```
CZUDE DVC FTL ERR 00021 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx - general message
HOST PROGRAM UDA AT 172150 RUNTIME 0:00:12 - basic message
UDA RESIDENT DIAGNOSTICS DETECTED FAILURE \
UDASA CONTAINS 104041 \:- extended message
REPLACE UDA MODULE M7161 /
```

The DUP program may also print error messages. They are printed exactly as presented by the DUP program and cannot be suppressed by any flags.

3.2 SPECIFIC ERROR MESSAGES

3.2.1 HOST PROGRAM ERROR MESSAGES

Following is a list of the error messages that may be printed by the diagnostic program. In the list, some of the numbers that may vary with execution or program version are shown as 'xxx'. These include program counters and runtime. Other numbers, such as unit number, drive number, UDA-50 address and data in registers are filled with sample numbers. Additional information about the error may follow the error message.

```
00001 CZUDE SYS FTL ERR 00001 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS
UDA HAS MORE THAN ONE VECTOR, BR LEVEL OR BURST RATE
```

When the hardware questions were answered, two units were selected with the same UNIBUS address but with a different vector, BR level or burst rate. A single UDA-50 can have only one vector, BR level or burst rate. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

```
00002 CZUDE SYS FTL ERR 00002 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS
TWO UNITS SELECT THE SAME DRIVE
```

The hardware questions for two units were exactly the same. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

00003 CZUDE SYS FTL ERR 00003 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS
MORE THAN EIGHT DRIVES SELECTED ON THIS UDA

Up to four physical disk drives can be attached to a UDA-50 at one time. A physical disk drive may be from one to four logical disk drives. Each logical disk drive is considered one unit to the diagnostic program. Even though more than eight logical disk drives can be attached to one UDA-50, the UDA-50 only supports eight. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

00004 CZUDE SYS FTL ERR 00004 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM RUNTIME x:xx:xx
NOT ENOUGH ROOM IN MEMORY TO TEST THE UNITS SELECTED
PLEASE START PROGRAM OVER AND TEST FEWER UNITS AT A TIME

This program does not limit the number of units that can be tested by specifying a maximum number. What limits the number is the amount of memory used to store data on each unit. You have exceeded the number of units that are testable at one time. Start program over and select fewer units.

00008 CZUDE SYS FTL ERR 00008 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
I DON'T LIKE THE ANSWERS YOU GAVE TO THE HARDWARE QUESTIONS
TWO UDA'S USE THE SAME VECTOR

The hardware questions for two units specified different UDA-50 Unibus addresses but identical vector addresses. The program is aborted and returns to the Runtime Services prompt so that you can change the hardware questions.

00009 CZUDE DVC FTL ERR 00009 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PRGGRAM RUNTIME x:xx:xx
ONLY ONE DISK CAN BE SELECTED IN HW QUESTIONS IN RESTORE MODE.
PLEASE START PROGRAM OVER AND SELECT ONLY ONE DISK.

If the operator chooses to run the formatter in RESTORE mode, then only one disk can be selected in the hardware questions. RESTORE mode is run in this way because a file containing the bad block information is used and that information matches only one drive.

00010 CZUDE DVC FTL ERR 00010 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM RUNTIME x:xx:xx
THIS PROGRAM CAN ONLY REFORMAT A DISK IN UNATTENDED MODE

This program needs to ask questions of the operator. It refuses to run in RECONSTRUCT and RESTORE modes because the questions obtain data that is absolutely necessary. REFORMAT mode is allowed to run because only a date is needed. The default date of 1-JAN-70 is used.

00020 CZUDE DVC FTL ERR 00020 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
MEMORY ERROR TRYING TO READ UDA REGISTERS
CHECK UNIBUS SELECTION SWITCHES ON UDA MODULE M7161
OR UNIBUS
OR REPLACE UDA MODULE M7161

A non-existent memory error occurred when the host program tried to access the UDAIP and UDASA registers. The UDA is at another address (check the UNIBUS selection switches) or module M7161 is broken or the UNIBUS is broken.

00021 CZUDE DVC FTL ERR 00021 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDA RESIDENT DIAGNOSTICS DETECTED FAILURE
UDASA CONTAINS 105154
REPLACE UDA MODULE M7162

The UDA Resident diagnostic detected a failure. The error is displayed in the UDASA. Here are the possible error values and their meaning:

- 104000 - Fatal sequencer error
- 104040 - D processor ALU error
- 104041 - D proc ROM parity error
- 105102 - D proc with no Board #2 or RAM parity error
- 105105 - D proc RAM buffer error
- 105152 - D proc SDI error
- 105153 - D proc write mode wrap SERDES error
- 105154 - D proc read mode SERDES, RSGEN, and ECC error
- 106040 - U proc ALU error
- 106041 - U proc Control Register error
- 106042 - U proc DFAIL/ROM parity error/Board #1 test count is wrong
- 106047 - U proc Constant ROM error with D proc running SDI test
- 106055 - Unexpected trap found, aborted diagnostic
- 106071 - U proc ROM error
- 106072 - U proc ROM parity error
- 106200 - Step 1 data error (MSB not set)
- 107103 - U proc RAM parity error
- 107107 - U proc RAM buffer error
- 107115 - Board #2 test count was wrong
- 112300 - Step 2 error
- 122240 - NPR error
- 122300 - Step 3 error
- 142300 - Step 4 error

Replace the board specified. M7161 is the Unibus interface board.
M7162 is the SDI interface board.

00022 CZUDE DVC FTL ERR 00022 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
STEP BIT DID NOT SET IN UDASA REGISTER DURING INITIALIZATION
STEP BIT EXPECTED 004000
UDASA CONTAINS 000000
REPLACE UDA MODULE M7161

The UDA did not respond as expected during the initialization sequence which communicates using data in the UDASA register. A normal response from the UDA contains either a STEP bit or an ERROR bit defined as follows:

Bit 15 (100000)	Error bit
Bit 14 (040000)	Step 4 bit
Bit 13 (020000)	Step 3 bit
Bit 12 (010000)	Step 2 bit
bit 11 (004000)	Step 1 bit

The expected step bit nor the error bit set within the expected time.

00023 CZUDE DVC FTL ERR 00023 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDA DID NOT CLEAR RING STRUCTURE IN HOST MEMORY DURING INITIALIZATION
6 WORDS WERE TO BE CLEARED STARTING AT ADDRESS 040644
FIRST SEVERAL WORDS NOT CLEARED (UP TO 6):

ADDRESS	CONTENTS
040644	000010
040650	000010
040652	000010

REPLACE UDA MODULE M7161

The UDA is to clear the ring structure (a communications area used by the UDA to talk to the host) in host memory before Step 4 of initialization. If the UDA diagnostics did not clear memory and did not flag an error, then error message 00023 is displayed. The contents of each word in memory is set to 177777 before the test. Failure of the UDA to clear each word indicates a fault in the address interface to the Unibus.

00024 CZUDE DVC FTL ERR 00024 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDASA REGISTER DID NOT GO TO ZERO AFTER STEP 3 WRITE OF INITIALIZATION
PURGE/POLE DIAGNOSTICS WERE REQUESTED
UDASA CONTENTS 004400

For better testing, the host can test the PURGE and POLE mechanism of the UDA. To do so the host sets bit15 of the step 3 data and sends the data to the UDA. The UDA must go to zero and wait for the purge and pole. If the UDA never went to zero, then error message 00024 is displayed. The UDA may have a bad M7161 module or the UNIBUS may be broken.

00025 CZUDE DVC FTL ERR 00025 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDA DID NOT RETURN CORRECT DATA IN UDASA REGISTER DURING INITIALIZATION
UDASA EXPECTED 004400
UDASA CONTAINS 004000
REPLACE UDA MODULE M7161

For each step of initialization, specific data is expected to be displayed in the UDASA. If the UDASA does not match the expected data, then error message 00025 is displayed. Replace UDA module M7161.

00030 CZUDE DVC FTL ERR 00030 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDA REPORTED FATAL ERROR IN UDASA REGISTER WHILE RUNNING DM PROGRAM
UDASA CONTAINS 100004

A message from the UDA firmware reports an unexpected failure. An error code is presented in the UDASA. Here is a list of the codes and their meanings:

- 004400 - UDA has been inited by either a bus init or by writing into the UDAIP.
- 100001 - UNIBUS envelope/packet read error (parity or timeout)
- 100002 - UNIBUS envelope/packet write error (parity or timeout)
- 100003 - UDA ROM and RAM parity error
- 100004 - UDA RAM parity error
- 100005 - UDA ROM parity error
- 100006 - UNIBUS ring read error
- 100007 - UNIBUS ring write error
- 100010 - UNIBUS interrupt master failure
- 100011 - Host access timeout error
- 100012 - Host exceeded credit limit
- 100013 - UDA SDI hardware fatal error
- 100014 - DM XFC fatal error
- 100015 - Hardware timeout of instruction loop
- 100016 - Invalid virtual circuit identifier
- 100017 - Interrupt write error on UNIBUS

00031 CZUDE DVC FTL ERR 00031 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
NO INTERRUPT RECEIVED FROM DM PROGRAM FOR 3 MINUTES
ASSUME PROGRAM IS HUNG

All DM programs are required to communicate with the host program; so as to assure the host program that the DM program is not hung up or in an endless loop. If the DM program has not done so, the host program assumes the DM is hung and this message appears.

00032 CZUDE DVC FTL ERR 00032 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
MESSAGE BUFFER RECEIVED FROM DM PROGRAM WITH UNKNOWN REQUEST NUMBER
MESSAGE BUFFER CONTAINS:
000001 000002 000003 000004 000005 000006 000007
000008 000009 000010 000011 000012 000013 000014
000015 000016 000017 000018 000019 000020 000021
000022 000023 000024 000025 000026 000027 000028
000029 000030 000031 000032 000033 000034 000035

The DM program and the host program communicate with each other using packets. Each packet must have a request number set up by the DM program and interpreted by the host program. This request number is not a known request number. The problem may be the UNIBUS or either one of the UDA modules or a corrupted DM program. Word 1 contains the DM request number, and word 2 typically contains the drive number. The rest of the buffer contains information specific to a DM request. The numbers in the example show the order in which words are displayed.

00033 CZUDE DVC FTL ERR 00033 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
00034 HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
RESPONSE PACKET FROM UDA DOES NOT CONTAIN EXPECTED DATA
EITHER UDA RETURNED ERROR STATUS OR PACKET WAS NOT RECEIVED CORRECTLY
COMMAND PACKET SENT RESPONSE PACKET RECEIVED
000000 000020 000000 000020
000000 000000 000000 000000
000000 000002 000000 000202
000000 014336 000000 014336
000000 034674 000000 034674
000000 000000 000000 000000
000000 000000 000000 000000
000000 051232 000000 051232
000000 000000 000000 000000
000000 000000 000000 000000
000000 000000 000000 000000
000000 000000 000000 000000

The host program inspected the response packet which was given by to UDA. The response packet may have been in error with one of the following points:

- 1) The end code was not as expected.
- 2) The status code showed an error occurred with the last command.
- 3) The command reference numbers (the first word) did not match.

If 1 or 3 occurred, there may have been a transmission problem between the UDA and the host program. If 2 occurred, check the error code in the MSCP specification for further information. The packets are displayed two long words per line, low order word and byte to the right (corresponding to the MSCP long-word entity).

00036 CZUDE DVC FTL ERR 00036 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
NO INTERRUPT RECEIVED FROM UDA FOR 30 SECONDS
WHILE LOADING DM PROGRAM

After a DM program has been sent to the UDA, the host program expects an interrupt within 30 seconds. The interrupt is used to assure the host program that the DM program is sane. If no interrupt occurred, then error message 00036 is displayed and the DM program is assumed to be hung.

00037 CZUDE DVC FTL ERR 00037 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
UDA REPORTED FATAL ERROR IN UDASA REGISTER WHILE LOADING DM PROGRAM
UDASA CONTAINS 100004
REPLACE UDA MODULE M7161

While loading the DM program to the UDA, the UDASA became non-zero. When this occurs, it signifies that the UDA microcode has run across a fatal error. The displayed value is in octal. Check the error code with the list in 00030.

00100 CZUDE DVC FTL ERR 00100 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
DUP PROGRAM ASKED UNEXPECTED QUESTION (25)

The DUP program sends a value that corresponds to a specific question or message. If this value does not fit into the range of questions, then this error appears.

00101 CZUDE DVC FTL ERR 00101 ON UNIT 00 TST 001 SUB 000 PC: xxxxxx
HOST PROGRAM UDA AT 172150 RUNTIME x:xx:xx
DUP PROGRAM REJECTED ANSWER TO DATE OR SERIAL NUMBER QUESTION

After the operator inputs the date/serial number, the DUP program will ask the host program for them. If for some reason the date/serial number was unacceptable to the DUP program, this error message will appear. Retry the program and if this error appears again, get out of the diagnostic runtime services and back to the XXDP+ prompt and reload the program.

3.2.2 DUP PROGRAM ERROR MESSAGES

Error messages returned by the UDA formatter are as follows:

GET STATUS failure

This could be caused by a number of reasons. Examples: the RUN/STOP switch is out, the WRITE PROTECT switch is in, or the DIAGNOSTIC REQUEST bit is set by the drive.

SDI send error

An attempt to send an SDI command failed. The signal RECEIVER READY was not asserted.

Unsuccessful SDI command

The response from an SDI command was unsuccessful and all commands should be successful for the formatter to work. There may be a cable problem, drive receiver problem or UDA transmitter problem.

SDI receive error

This message is presented for several reasons. The drive timed out, the first word from the drive was not a start frame, there was a framing error on the SDI level 0 read (cable/receiver/transmitter problem), checksum error, or the buffer size given by the formatter wasn't large enough for the UDA. Again, there may be a cable/receiver/transmitter problem.

UNIBUS read error

This is caused by one of two problems. While trying to read an overlay into the UDA buffer memory, the formatter came across a nonexistent memory error. Or, there was a failure while downline loading the bad block information. There may be something wrong with the UNIBUS or the UDA module M7161.

Formatter initialization error

For this error to occur, the UDA must be processing the DM code improperly.

Nonexistent unit number

The desired disk drive wasn't attached to the UDA.

DBN/XBN format error (drive FORMAT command failed)

All attempts and retries to format a track failed. There may have been a timeout of drive signals, the drive dropped the READ/WRITE READY signal during the format operation or the drive clock timed out (which indicates cable/transmitter/receiver failures).

FCT does not have enough good copies of each block

There must at least two good copies of every block in the FCT. For this error to occur, the media is badly corrupted or the read/write logic is failing.

SEEK error

After a seek command completed successfully, the READ/WRITE READY signal was never set or the ATTENTION signal was set.

RCT does not have enough good copies of each block

There must be at least two good copies of every block in the RCT. For this error to occur, the media is badly corrupted or the read/write logic is failing.

LBN format error (drive FORMAT command failed)

All attempts and retries to format a track failed. There may have been a timeout of drive signals, the drive dropped the READ/WRITE READY signal during the format operation or the drive clock timed out (which indicates cable/transmitter/receiver failures).

FCT write error

A particular block failed to be written into every copy of the FCT. There is either terribly bad media or a write logic failure.

RCT read error

The formatter could not read at least one good copy of a particular block in the RCT area.

RCT write error

A particular block failed to be written into every copy of the RCT. There is either terribly bad media or a write logic failure.

RCT full

There were so many bad blocks on the media that the RCT area was filled and could not hold any more. There could be read/write logic failure or bad cable connection.

FCT read error

The formatter could not read at least one good copy of a particular block in the FCT area.

FCT downline-load error

The formatter was led to believe that a bad block information file was larger than it really was. There may be a UNIBUS or M7161 problem.

Drive init timeout

After the drive was inited, the RECEIVER READY signal never asserted.

Illegal response to start-up question

An overflow occurred when the serial number went over 64 bits.

An example of how the errors are presented is below:

RUNTIME 0:00:18
Nonexistent unit number

4.0 PERFORMANCE AND PROGRESS REPORTS

There is no statistical report that can be printed using the Diagnostic Runtime Services PRINT command.

The DUP program issues the following messages upon normal completion:

Format completed

n Revectored LBNS

Where n is the number of LBNS revectored in the user data area.

n Primary revectored LBNS

Where n is the number of LBNS in message #2 which were primary revectorers.

n Secondary/teritary revectored LBNS

Where n is the number of the LBNS in message #2 which were secondary or tertiary revectorers.

n Bad blocks in the RCT area due to data errors

Where n is the number of blocks in the total RCT area which were bad.

n Bad blocks in the DBN area due to data errors

Where n is the number of blocks in the total DBN area which were bad.

n Bad blocks in the XBN area due to data errors

Where n is the number of blocks in the total XBN area which were bad.

n Blocks retried on the check pass

Where n is the number of blocks which had an error on the first read attempt after formatting.

FCT used successfully or
FCT was not used

Depending on the answers to the software questions and the availability of the bad sector information (FCT), one of these messages will be printed.

An example of how the messages are presented is below.

```
RUNTIME 0:24:57
Format completed
  5 Revectorized LBNS
  5 Primary revectorized LBNS
  0 Secondary/tertiary revectorized LBNS
  0 Bad blocks in the RCT area due to data errors
  0 Bad blocks in the DBN area due to data errors
  0 Bad blocks in the XBN area due to data errors
  5 Blocks retried on the check pass
FCT was not used
```

5.0 TEST SUMMARIES

There is only one test in this program - Test #1. Its only purpose is to load and run the format program in a UDA-50.

;MACRO DEFINITIONS FOR GLOBAL EQUATES

;THESE MACROS ARE USED TO DEFINE INDEXES INTO A TABLE

;CALLING SEQUENCE MUST BE

```
TABLE  
ITEM NAME BYTES  
ITEM NAME BYTES  
ITEM NAME BYTES  
END SIZE
```

;TABLE DEFINES THAT A TABLE IS ABOUT TO BE DEFINED AND END TERMINATES THE DEFINITION.
;ANY NUMBER OF ITEM LINES CAN APPEAR. NAME IS THE NAME OF THE SYMBOL BEING EQUATED TO
;THE INDEX. THE INDEX ALWAYS STARTS AT ZERO. BYTES SPECIFIES THE SIZE OF THE VALUE TO BE
;STORED AT THAT INDEX IN BYTES. THE SIZE ARGUMENT TO THE END STATEMENT IS OPTIONAL, IT
;BE EQUATED TO THE SIZE OF THE TABLE IN BYTES. THE SYMBOL TINDEX IS USED TO KEEP TRACK
;OF THE INDEX VALUE AND WILL BE EQUAL TO THE SIZE OF THE TABLE AFTER THE END STATEMENT.

```
.MACRO TABLE  
    TINDEX=0  
.ENDM  
  
.MACRO ITEM NAME BYTES  
    NAME=TINDEX  
    TINDEX=TINDEX+BYTES  
.ENDM  
  
.MACRO END SIZE  
    .IF NB SIZE  
    SIZE=TINDEX  
    .ENDC  
.ENDM
```

:UDAI1T
:FUNCTIONAL DESCRIPTION:
:   SUBROUTINE TO INITIALIZE A UDA AND BRING IT ON-LINE.
:   ALL STEPS ARE CHECKED. AN ERROR MESSAGE IS REPORTED IF ANY ERROR
:   DETECTED.
:INPUTS:
:   R5 - ADDRESS OF CONTROLLER TABLE.
:IMPLICIT INPUTS:
:   C.RING(R5) - ADDRESS GIVEN TO UDA AS START OF RING BUFFER.
:   LENGTH OF RING STRUCTURE IS ONE ENTRY EACH.
:OUTPUTS:
:   CONDITION Z - SET IF ANY ERROR REPORTED. CLEAR IF NO ERROR.
:   R4 - ADDRESS OF UDAIP REGISTER IN UDA
:   R5 - UNCHANGED.

:FILL HOST COMMUNICATION AREA WITH ALL ONES

UDAI1T: MOV C.RING(R5),R2                ;GET FIRST ADDRESS OF RING BUFFER

.SBTTL SOFTWARE PARAMETER CODING SECTION

;++
: THE SOFTWARE PARAMETER CODING SECTION CONTAINS MACROS
: THAT ARE USED BY THE SUPERVISOR TO BUILD P-TABLES. THE
: MACROS ARE NOT EXECUTED AS MACHINE INSTRUCTIONS BUT ARE
: INTERPRETED BY THE SUPERVISOR AS DATA STRUCTURES. THE
: MACROS ALLOW THE SUPERVISOR TO ESTABLISH COMMUNICATIONS
: WITH THE OPERATOR.
