64000

HP64000 Logic Development System

Model 64602A Timing Acquisition Board

HEWLETT PACKARD

CERTIFICATION

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Bureau of Standards, to the extent allowed by the Bureau's calibration facility, and to the calibration facilities of other International Standards Organization members.

WARRANTY

This Hewlett-Packard system product is warranted against defects in materials and workmanship for a period of 90 days from date of installation. During the warranty period, HP will, at its options, either repair or replace products which prove to be defective.

Warranty service of this product will be performed at Buyer's facility at no charge within HP service travel areas. Outside HP service travel areas, warranty service will be performed at Buyer's facility only upon HP's prior agreement and Buyer shall pay HP's round trip travel expenses. In all other cases, products must be returned to a service facility designated by HP.

For products returned to HP for warranty service. Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

HP warrants that its software and firmware designated by HP for use with an instrument will execute its programming instructions when properly installed on that instrument. HP does not warrant that the operation of the instrument, or software, or firmware will be uninterrupted or error free.

LIMITATION OF WARRANTY

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

EXCLUSIVE REMEDIES

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

ASSISTANCE

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office. Addresses are provided at the back of this manual.

CW&A 2/81

HEWLETT-PACKARD

SERVICE MANUAL

MODEL 64602A

TIMING ACQUISITION BOARD

REPAIR NUMBERS

This Manual applies directly to Models
with Repair Numbers prefixed 2148A.

Manual Part Number: 64602-90902
Microfiche Part Number: 64602-90802

PRINTED: OCTOBER 1982
CHANGED: NOVEMBER 1982

SAFETY SUMMARY

The following general safety precautions must be observed during all phases of operation, service, and repair of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Hewlett-Packard Company assumes no liability for the customer's failure to comply with these requirements.

GROUND THE INSTRUMENT.

To minimize shock hazard, the instrument chassis and cabinet must be connected to an electrical ground. The instrument is equipped with a three-conductor ac power cable. The power cable must either be plugged into an approved three-contact electrical outlet or used with a three-contact to two-contact adapter with the grounding wire (green) firmly connected to an electrical ground (safety ground) at the power outlet. The power jack and mating plug of the power cable meet International Electrotechnical Commission (IEC) safety standards.

DO NOT OPERATE IN AN EXPLOSIVE ATMOSPHERE.

Do not operate the instrument in the presence of flammable gases or fumes. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.

KEEP AWAY FROM LIVE CIRCUITS.

Operating personnel must not remove instrument covers. Component replacement and internal adjustments must be made by qualified maintenance personnel. Do not replace components with power cable connected. Under certain conditions, dangerous voltages may exist even with the power cable removed. To avoid injuries, always disconnect power and discharge circuits before touching them.

DO NOT SERVICE OR ADJUST ALONE.

Do not attempt internal service or adjustment unless another person, capable of rendering first aid and resuscitation, is present.

DO NOT SUBSTITUTE PARTS OR MODIFY INSTRUMENT.

Because of the danger of introducing additional hazards, do not install substitute parts or perform any unauthorized modification of the instrument. Return the instrument to a Hewlett-Packard Sales and Service Office for service and repair to ensure that safety features are maintained.

DANGEROUS PROCEDURE WARNINGS.

Warnings, such as the example below, precede potentially dangerous procedures throughout this manual. Instructions contained in the warnings must be followed.

WARNING

Dangerous voltages, capable of causing death, are present in this instrument. Use extreme caution when handling, testing, and adjusting.

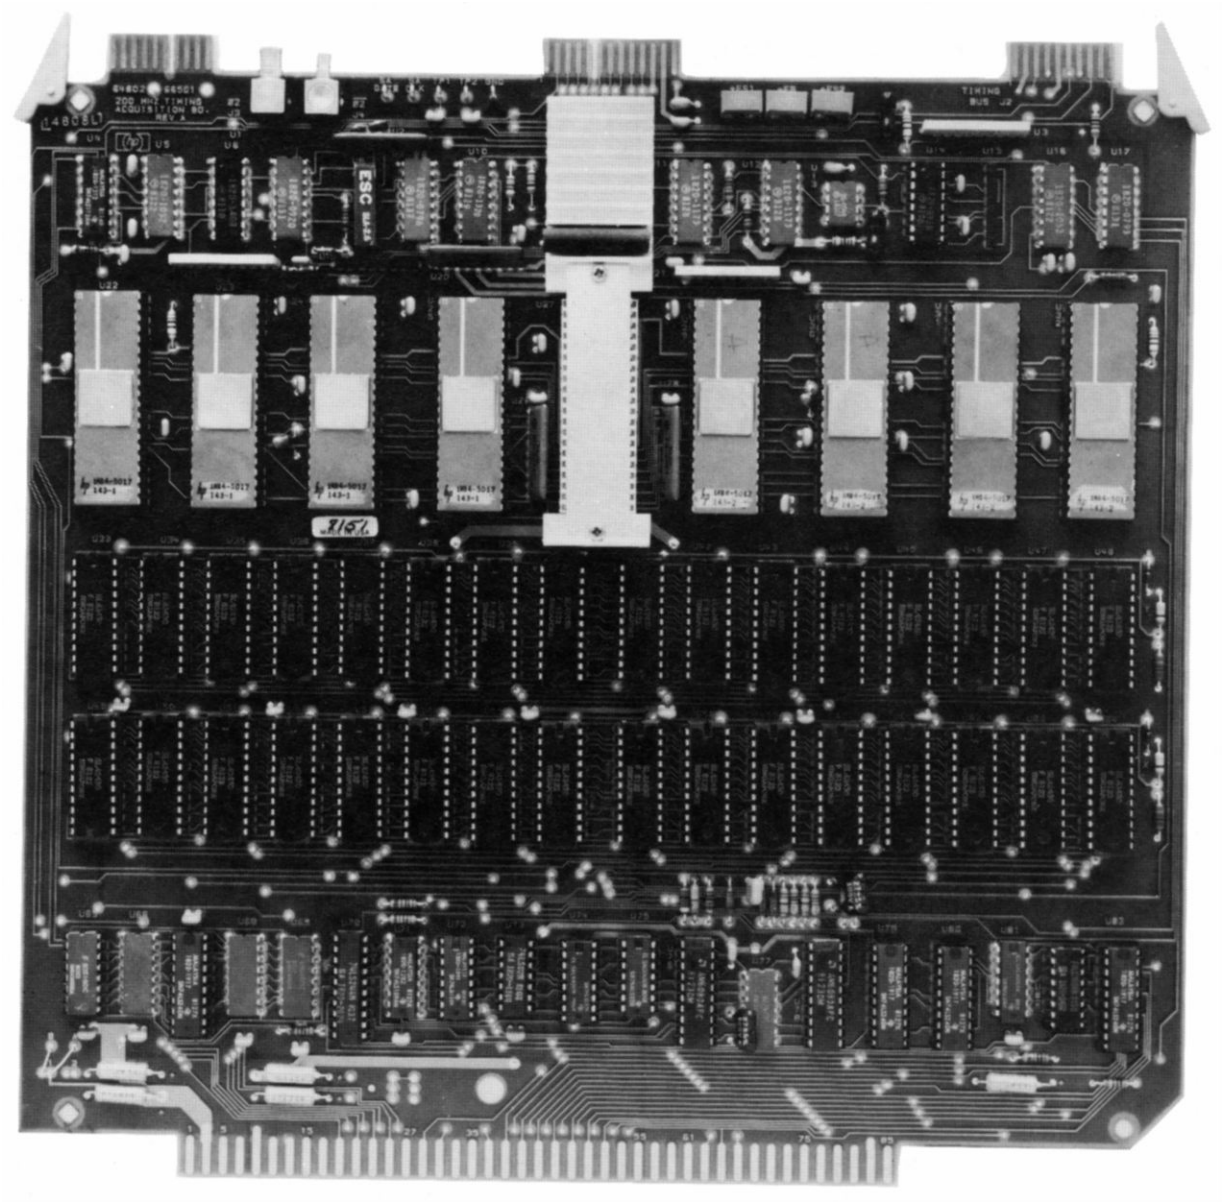

Figure 1-1. Model 64602A Timing Acquisition Board

SECTION I

GENERAL INFORMATION

1-1. INTRODUCTION.

1-2. This Service Manual contains information required to install, test and service the Hewlett-Packard Model 64602A Timing Analysis Acquisition Board. Operating instructions are provided in a separate Operating Manual supplied with the instrument.

1-3. Shown on the title page is a microfiche part number. This number can be used to order 4X6-inch microfilm transparencies of the manual. Each microfiche contains up to 96 photoduplicates of the manual pages.

1-4. INSTRUMENTS COVERED BY THIS MANUAL.

1-5. Attached to the instrument or printed on the printed circuit board is the repair number. The repair number is in the form: 0000A0000. It is in two parts; the first four digits and the letter are the repair prefix, and the last five are the suffix. The prefix is the same for all identical instruments. The suffix, however, is assigned sequentially and is different for each instrument. The contents of this manual apply to instruments with the repair number prefix(es) listed under REPAIR NUMBERS on the title page.

1-6. An instrument manufactured after the printing of this manual may have a repair number prefix that is not listed on the title page. This unlisted repair number prefix indicates that the instrument is different from those described in this manual. The manual for this newer instrument is accompanied by a Manual Changes supplement. This supplement contains "change information" that explains how to adapt the manual for the newer instrument.

1-7. In addition to change information, the supplement contains information for correcting errors in the manual. To keep this manual as current as possible, Hewlett-Packard recommends that you periodically request the latest Manual Changes supplement. The supplement for this manual is identified with the manual print date and part number, both of which appear on the manual title page. Complimentary copies of the supplement are available from Hewlett-Packard.

1-8. For information concerning a repair number prefix that is not listed on the title page or in the Manual Changes supplement, contact your nearest Hewlett-Packard Office.

1-9. DESCRIPTION.

1-10. The Timing Analyzer is used to monitor information flow in the time domain. The information may be a software program, the actions of a hardware state machine, or random logic signals.

1-11. The Timing Analyzer consists of one Model 64601A Timing Control Board, and from one to two Timing Data Acquisition Boards.

1-12. Up to two Acquisition Boards may be combined to form a Timing Analyzer with as many as 16 channels.

1-13. Logic Analyzers within one Mainframe may be connected together using the Inter Module Bus (IMB). One possible use of the IMB is to allow a State Analyzer to trigger a Timing Analyzer.

1-14. SPECIFICATIONS.

1-15. Instrument specifications are listed in Table 1-1. These specifications are the performance standards or limits against which the instrument is tested.

Table 1-1. Specifications.

Includes Models 64601A Control Board, 64602A 8-Channel Acquisition, and 64604A 8-Channel Timing Probes.

Sample rates
- Wide Sample Mode: variable from 2Hz to 200MHz.
- Glitch mode: variable from 2Hz to 100MHz.
- Dual Threshold: same as Wide Sample Mode.
- Fast Sample: 400MHz.

Memory length:
- Wide Sample, Glitch, & Dual Threshold Modes: 4060 samples.
- Fast Sample Mode.....: 8140 samples.

Memory width (8 channel system)
- Wide Sample.....: 8 channels.
- Dual Threshold, Glitch, and 400MHz modes: 4 channels.

Memory width (16 channel system--two acquisition boards)
- Double the width for a single, 8-channel system.

Resolution:
- Total skew from probe tip:
  - Within pod: +/- 1.5ns.
  - Pod to pod: +/- 3.0ns.
    - Conditions: Input signal: VH = -1.0V, VL = -1.6V, VTH at -1.3V
      Input slew rate > .25 V/ns
- Sample rate accuracy: typically +/- .002%

Probe characteristics
- Input Z: 100K ohms +/- 2%, shunted by <6pf.
- Drive requirements:
  - Minimum input amplitude: 600mV P/P.
  - Minimum input overdrive: 200mV or 25% of input amplitude, whichever is greater.
  - Minimum input pulse width: 3.0ns at threshold.
- Dynamic range: +/- 10V.
- Maximum input: +/- 40V.
- Threshold accuracy: +/- 50mV or +/- 2% whichever is greater.
- Hysteresis: Typically 50mV.

Glitch Mode
- Maximum sample rate: 100MHz.
- Minimum width: 3.0ns at threshold.
- Maximum width: sample period less 4.0ns.

Specifications (continued)

Triggering

Time duration accuracy: +/- (20% + 2ns).
Minimum width for narrower-than trigger: 6ns typical.
Minimum width for transition trigger: 6ns typical.
Displayed position accuracy: +/- 4 samples in Wide Sample, Dual Threshold, and Glitch Modes.
: +/- 8 samples in Fast Sample Mode.
Delay from input to external BNC drive: Typically 60ns.
Delay from input to internal IMB drive: Typically 55ns.
Dead time for post-qualify measurement reset.
Typically 50ns + the time required to fill the memory with the selected amount of pre-trigger information.
Reset time for duration trigger: To meet the duration specifications, the trigger duty cycle must be no greater than 40%.

BNC Drive

Output signal swing in transition trigger mode:
Amplitude: 2.0V typical.
Width at 50%: 10ns typical.
Output signal swing in width greater-than trigger mode:
Amplitude: 2.5V typical.
Width: Input trigger width minus the selected duration.
Output signal swing in width less-than trigger mode:
Amplitude: same as in transition trigger mode.
Width: same as in transition trigger mode.

Position: occurs when trigger pattern disappears, before the selected duration times out.

IMB Functions (interconnection with other modules):

Master Enable (LE/ME)-------: drive, receive (Execute/Halt only)
Trigger Enable (LE/TE)------: drive, receive.
Trigger (HE/TR)-------------: drive, receive.
Delay Clock (HE/DLCK)-------: receive only.
Storage Enable (LE/SE)------: not used.

SECTION II

INSTALLATION

2-1. INTRODUCTION.

2-2. This section contains information for installing the Model 64602A. Included are initial inspection procedures, preparation for use, and instructions for repacking the instrument for shipment.

2-3. INITIAL INSPECTION.

2-4. Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, it should be kept until contents of the shipment have been checked for completeness and the instrument has been checked mechanically and electrically. Procedures for checking electrical performance are given in Section IV. If the contents are not complete, if there is mechanical damage or defect, or if the instrument does not pass the Performance Tests, notify the nearest Hewlett-Packard Office. If the shipping container is damaged, or if the cushioning material shows signs of stress, notify the carrier as well as the Hewlett-Packard Office. Keep the shipping materials for carrier's inspection. The HP office will arrange for repair or replacement at HP option without waiting for claim settlement.

2-5. PREPARATION FOR USE.

2-6. There are no specific preparation for use procedures except the actual installation of the boards in the Mainframe cardcage.

2-7. INSTALLATION INSTRUCTIONS.

WARNING

WHEN REMOVING OR INSTALLING THE TIMING ANALYZER BOARDS,
THE MAINFRAME A.C. LINE POWER MUST BE TURNED OFF.

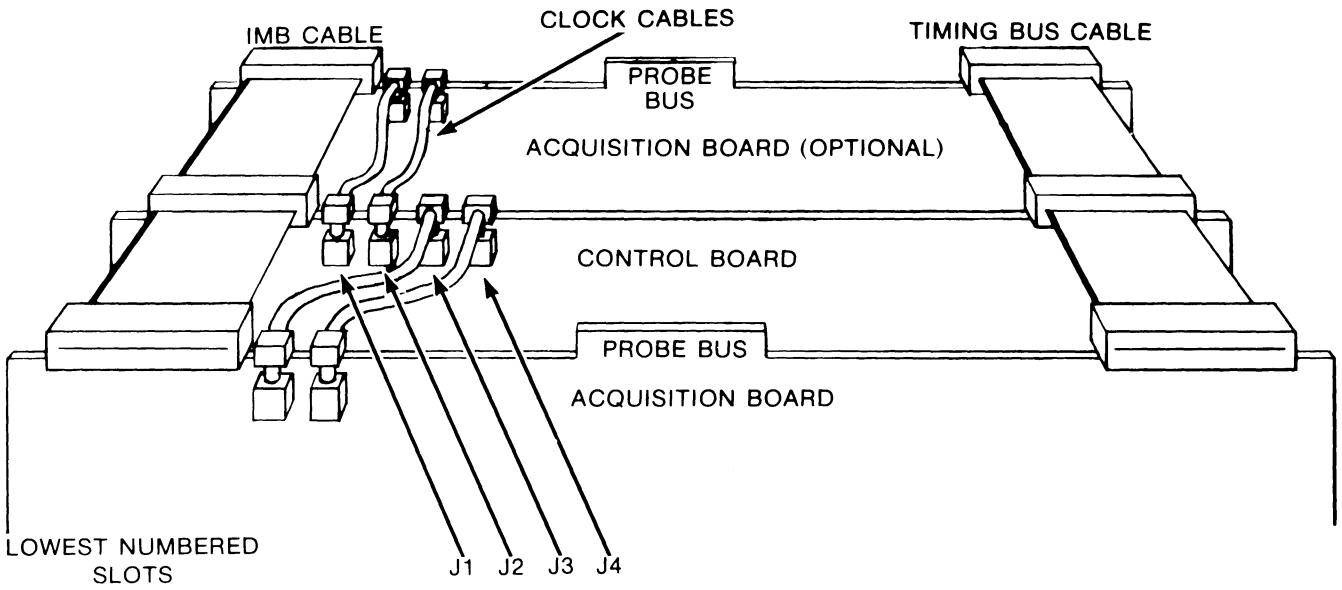

Figure 2-1. Timing Configuration

2-8. Mainframe Configuration.

2-9. Depending on the number of channels required, the timing analyzer will use two or three card slots of the mainframe cardcage.

2-10. One Timing Acquisition Board (64602A) should be installed in the lowest numbered card slot available. The Timing Control Board (64601A) then goes in the next higher slot. And if there is a second Acquisition Board, it will go in the next higher slot. In other words, Acquisition Boards are installed on either side of the Control Board. SEE FIGURE 2-1.

2-11. Up to two Acquisition Boards may be installed with one Control Board, forming one Timing Analysis Subsystem.

2-12. Inter Module Bus (IMB).

2-13. Some systems may contain a combination of a Timing Analyzer and another type of Analysis Subsystem. The Inter Module Bus, located at the upper left-hand corner of the board (when viewing from the component side) connects two or more analysis modules together for controlling and arming purposes. For example, a Timing Analyzer may arm a State Analyzer, and vice versa.

2-14. Although the 64602A has an Inter Module Bus jack, there is no electrical connection between this IMB jack and the rest of the board. The 64602A communicates with the IMB through the 64601A Timing Control Board. Since there is no electrical connection to the 64602A IMB jack and the rest of the board, this jack may have a ribbon cable connected to it for mechanical support.

2-15. Probe Bus

2-16. The timing analyzer communicates with the system under test by means of the 64604A Timing Probe. The probe cable connects to the probe bus located on the top center of the 64602A acquisition board.

2-17. Clock Cables.

2-18. Each 64602A acqusition board requires two clock inputs from the control board. Sample clocks are supplied from the control board via BNC cables connected to J1 and J2 on the upper left-hand part of the acqusition board.

2-19. Clocks should be paired: The left-hand two jacks, J1 and J2, on the control board should be connected to one acquisition board; and the right-hand two jacks should be connected to any second acquisition board.

2-20. Timing Bus.

2-21. The timing bus is at the top right-hand corner of the 64602A Acquisition Board (when viewing from the component side). The timing bus connects the timing Control Board to one or two Acquisition Boards.

2-22. The timing Control and Acquisition Boards must be grouped together to allow the timing bus ribbon cable to connect the Control Board to the Acquisition Board. When there are two Acquisition boards, which are placed on either side of the Control Board, a 3-position ribbon cable is used. Use only the timing bus cable with a part number given in the 64601A Control Board parts list. See FIGURE 2-2.

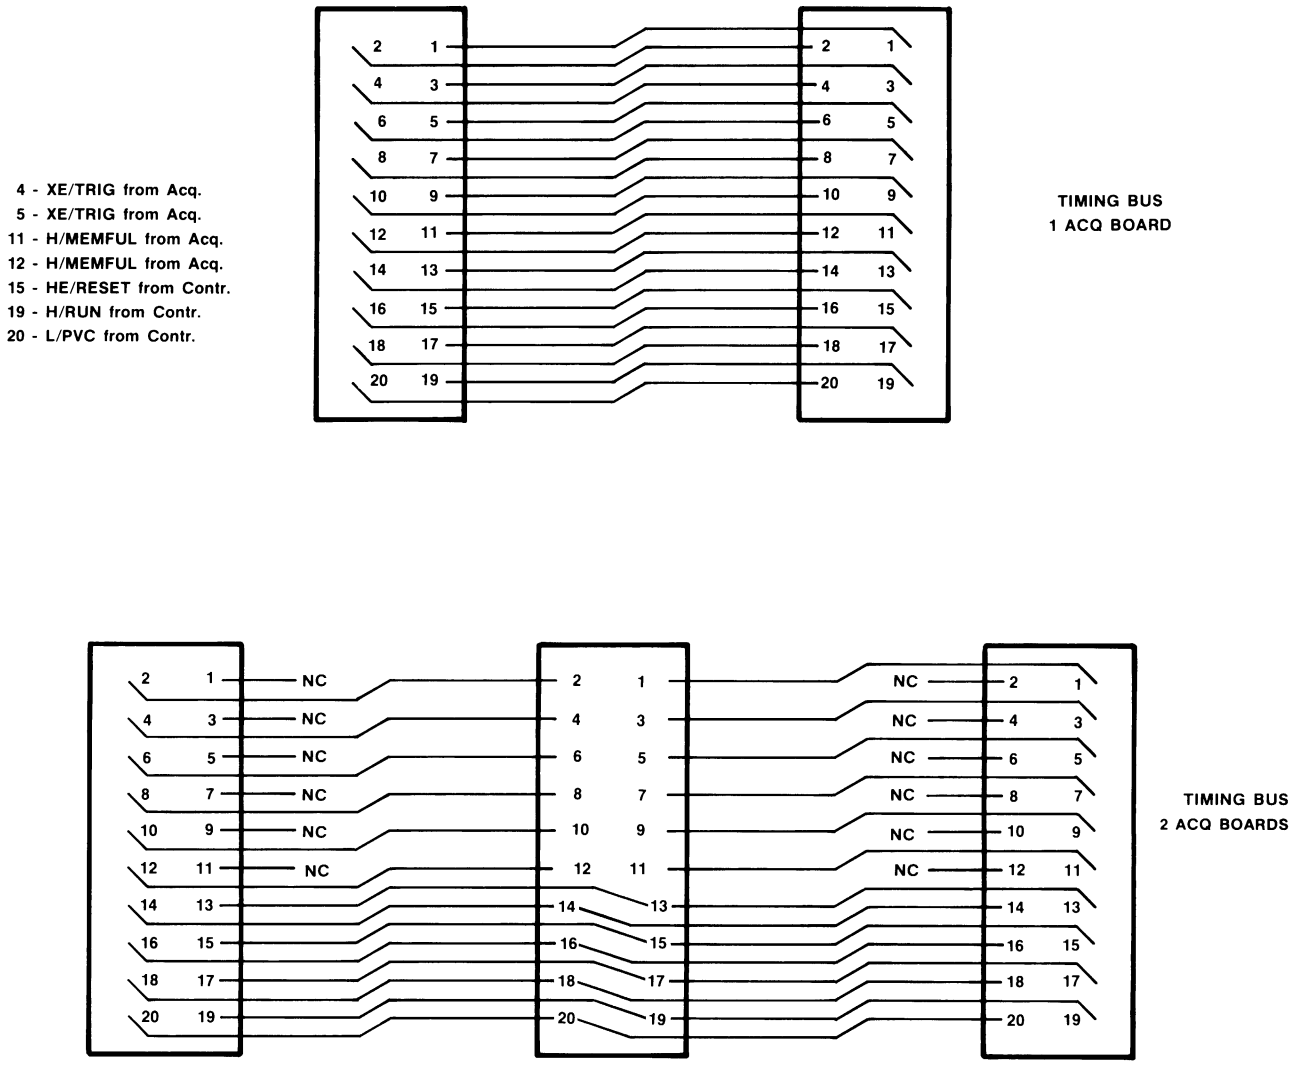

Figure 2-2. Timing Bus Cables

2-23. OPERATING, STORAGE, AND SHIPMENT ENVIRONMENTS.

CAUTION

THE GLITCH (U27) AND ENCODER (U22-25, U29-32) CHIPS ARE VERY SENSITIVE TO STATIC. THEY SHOULD BE LEFT IN CONDUCTIVE FOAM UNTIL INSTALLATION. GROUNDING STRAPS AND A GROUNDED WORK STATION ARE RECOMMENDED WHEN HANDLING THE ICS.

2-24. Operating Environment.

2-25. The Model 64602A may be operated in environments within the limits shown below. It should be protected from temperature extremes which cause condensation within the instrument.

Temperature.....+10° to +40° degrees Celsius
Humidity.....5% to 80% relative humidity
Altitude.....15 000 m (50 000 ft)

2-26. Storage Environment.

2-27. The Model 64602A may be stored or shipped in environments within the following limits:

Temperature.....-40° to +70° degrees Celsius
Humidity.....5% to 80% relative humidity
Altitude.....15 000 m (50 000 ft)

2-28. Packing.

2-29. Tagging for Service. If the instrument is to be shipped to a Hewlett-Packard Sales/Service Office for service or repair, attach a tag showing owner (with address), complete instrument repair number, and a description of the service required.

2-30. Original Packing. Containers and materials identical to those used in factory packing are available through Hewlett-Packard Offices. Mark the container FRAGILE to ensure careful handling. In any correspondence, refer to the instrument by model number and complete repair number.

2-31. Other Packing. The following general instructions should be used for repacking with commercially available materials:

a. Wrap instrument in heavy plastic or paper. (If shipping to Hewlett-Packard Office or Service Center, attach a tag indicating type of service required, return address, model number, and complete repair number.

b. Use a strong shipping container. A double wall carton made of 350 pound test material is adequate.

c. Use a layer of shock-absorbing material 70 to 100 mm (3 to 4 inches) thick around all sides of the instrument to provide firm cushioning and prevent movement inside container.

d. Seal shipping container securely.

e. Mark shipping container FRAGILE to ensure careful handling.

f. In any correspondence, refer to instrument by model number and complete repair number.

SECTION III

OPERATION

The operation of the Model 64602A is a function of the system software. Complete system keyboard operation is beyond the scope of the service manual. Please refer to the operator's manual (64601-90903) for the procedure.

NOTES

SECTION IV

PERFORMANCE TESTS

4-1. SECTION IV TABLE OF CONTENTS.

4-2. INTRODUCTION.

4-3. Performance verification tests check the major circuit blocks for proper operation, giving the operator at least 90% confidence that the board is operating correctly.

4-4. There are 9 PV Tests and 2 Supplementary Tests. The supplementary tests use different access instructions. They are described after the the regular 9 PV tests.

4-5. Signature analysis instructions and tables are given at the end of the section.

4-6. The performance verification tests are also used in troubleshooting: (1) They help to isolate troubles to particular blocks, and within particular blocks; (2) Each test corresponds to a one signature loop when running signature analysis.

4-7. Each test is shown on the mainframe screen as a bracket group of 0's. The 0's correspond to steps in a particular test. When the board fails a test step, the "0" for that step becomes a "1".

4-8. TROUBLESHOOTING TECHNIQUES.

4-9. Although each of the PV tests checks a specific circuit block, signals from other blocks are used. A failure in one block can be caused by failures in blocks upstream. The following steps are suggested for troubleshooting.

4-10. Check board seating.

4-11. Check cable connections.

All cables should be fastened securely. The clock cables should be paired on the left or right two jacks. The timing bus and IMB cables should have the pin 1 wire connected to pin 1 on the jack. No cables other than the two listed in the 64601A Control Board manual parts list may be used for the timing bus.

4-12. Check supply voltages.

Supply voltages from the mainframe (+5V, -5.2V, -12V) should be within 5%. The -3.25V should be within 3%.

4-13. Isolate the problem to one board.

When a PV failure occurs, isolate the problem to either an acquisition board, or the control board. Check signatures on the timing bus, which connects the control board to the acquisition board(s). Look first at the signals HE/RUN and HE/RESET from the control board. If these are good, look at the return signals from the acquisition board(s), H/MEMFUL, XE/TRIG1(2). In a two-acquisition board system, H/MEMFUL comes from the acquisition board in the lower numbered slot only.

4-14. Check the programming.

In PV tests the mainframe stimulates the timing analyzer and verifies correct operation by looking at the status registers. Read each test description to see what is being stimulated. Look at the signatures on the outputs of address decoders, data latches, and mode registers where the mainframe is stimulating that PV test circuit block. Correct signatures may be traced back to where signals become incorrect.

4-15. Check the status registers.

A PV failure means the status registers for the acquisition board on service sheet 5 will have one or more incorrect output signatures. The signal path may then be traced back to the problem.

4-16. PHYSICAL SETUP CONDITIONS FOR THE PV TESTS.

4-17. Conditions for the following tests:

a. Connect the timing pod to the 64602A acquisition board by means of timing cable 64604-61601.

b. Leave the probe leads disconnected, so that the probe inputs are floating near ground.

c. Make sure the two clock cables are securely connected. Clock cables should be connected in pairs to either the two right or two left jacks of the 64601A control board.

d. The timing bus cable should be connected to the jacks at the upper right hand corner (when viewing from the component side) of both the 64601A control board and the one or two 64602A acquisition board(s). Only timing bus cables (two or three position) listed in the 64601A parts list should be used.

e. NOTE: In noisy environments, ground each probe input, using the ground lead for each probe. Failure to do this may result in the PV displaying intermittent, non-existent failures.

CAUTION

THE GLITCH (U27) AND ENCODER (U22-25, U29-32) CHIPS ARE VERY SENSITIVE TO STATIC. THEY SHOULD BE LEFT IN CONDUCTIVE FOAM UNTIL INSTALLATION. GROUNDING STRAPS AND A GROUNDED WORK STATION ARE RECOMMENDED WHEN HANDLING THE ICS.

4-18. KEYBOARD SETUP (For running all nine PV tests repeatedly).

4-19. To verify that the entire board is operating correctly, perform the following steps on the mainframe keyboard:

a. With the operating system initialized and awaiting a command, press the softkey labeled "opt_test" (you may have to keep pressing the "etc" softkey until you see "opt_test" on the screen). Or you may type "option_test" in lower case.

b. Press [RETURN]. You should see a listing of all the optional boards that are present in your mainframe, along with their slot numbers.

c. Type in the Timing Acquisition Board slot number.

d. Press [RETURN].

e. Press softkey "run".

f. Press softkey "slot".

g. Type in the Timing Acquisition Board slot number.

h. Press softkey "repeated".

i. Press [RETURN]. As shown in Figure 4-1, the screen will now show all 9 Acquisition Board PV tests. Tests that pass will be indicated by "0", and failures will be indicated by "1". The screen will also show the number of times the tests are run, and the number of failures.

j. When finished with the test, press the "stop" softkey.

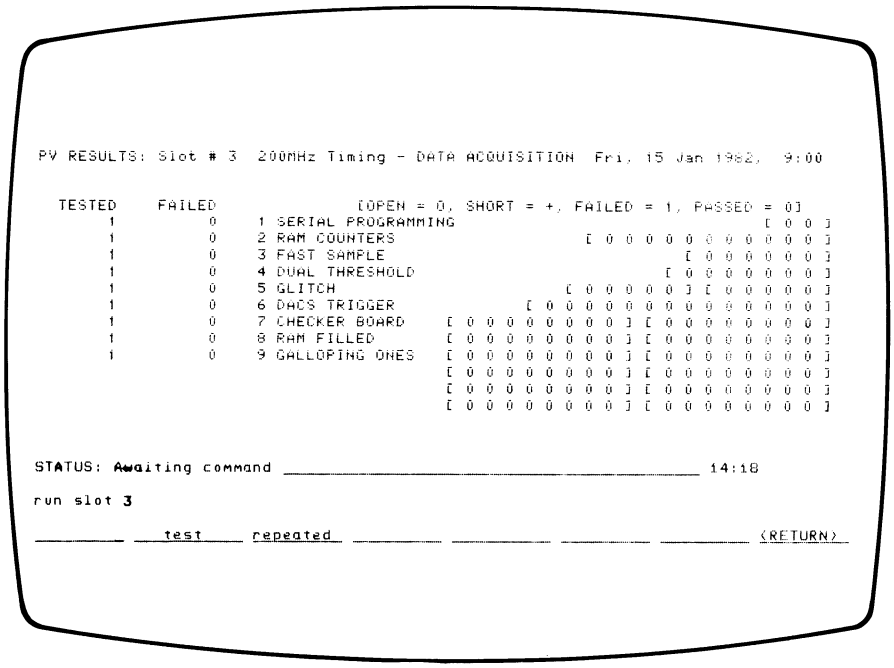

Figure 4-1. Display of PV Tests.

4-20. KEYBOARD SETUP (For running one PV test repeatedly).

4-21. To run one test at a time repeatedly for signature analysis, perform the following steps: (See Figures 4-2 to 4-10)

a. Press softkey "opt_test"; RETURN.

b. Type in the Timing Acquisition Board slot number; RETURN.

c. Press softkey "run".

d. Press softkey "slot".

e. Type in the Timing Acquisition Board slot number.

f. Press softkey "test". The screen will now list all

g. the Timing Acquisition Board PV tests.

h. Type in the number of the test you wish to run.

i. Press the soft key "repeated".

j. Press [RETURN].

4-22. EXPLANATION OF THE TEST DESCRIPTIONS.

4-23. There are 9 performance verification tests for the Timing Acquisition Board. Each of these tests has one or more TEST STEPS, denoted by the 0's or 1's within brackets. A "0" in the bracket indicates a PASS for that test step; and a "1" indicates FAIL.

1. SERIAL PROGRAMMING	[00]
2. RAM COUNTERS	[00000000000]
3. FAST SAMPLE	[000000]
4. DUAL THRESHOLD	[0000000]
5. GLITCH	[00000][00000]
6. DACS TRIGGER	[00000000000000]
7. CHECKER BOARD	[00000000][00000000]
8. RAM FILLED	[00000000][00000000]
9. GALLOPING ONE'S	[00000000][00000000]
	[00000000][00000000]
	[00000000][00000000]
	[00000000][00000000]

4-24. The numbered TEST STEPS described in each PV test correspond, from left to right, to the 0's or 1's within the displayed brackets.

4-25. The numbered TEST STEPS describe the commands given by the system software. They do not call for operator intervention.

4-26. TEST 1: SERIAL PROGRAMMING [0 0]

test steps: 1 2

4-27. Purpose. This test checks the glitch chip (U27) programming.

4-28. Test Steps. (Description of software execution)

1. The 20-bit glitch chip holding register is loaded with all HIGHs and a single LOW is walked through. After 20 clocks, nineteen HIGHs and one LOW should have appeared at the holding register output (U27-8).

2. The holding register is loaded with all LOWs and a single HIGH is clocked through. After 20 clocks, a HIGH should appear at U27-8.

4-29. D/A Converter Adjustment.

This test will also allow adjustment of the -FS(full scale) pot for the D/A converters. The -FS, +FS1, and +FS2 pots are located together at the top of the board.

See Section 5 for the adjustment procedure.

4-30. TEST 2: RAM COUNTERS [0 0 0 0 0 0 0 0 0 0 0]

test steps: 1 2 3 4 5 6 7 8 9 10 11

4-31. Purpose. This test checks memory-address-counter clocking and counting.

4-32. Test Steps. (Description of software execution)

1. Analyzer is reset. The X-counters should read 00H. (Y-counters cannot be read directly). H/MEMFUL should be false.

2. Memory Address Counters are set to AAH (AAx and AAy).

3. X-counter is clocked to FFH. (Since the Y-counter is behind, at most, by one clock, it will be at FFH or FEH).

4. X-counter is clocked once more. It should read 00H.

5. Analyzer is clocked to one before the memory is full. Both X and Y counters should be 01H. H/MEMFUL should still be false.

The wrap-around latch (U4) sends H/MEMFUL to the mainframe processor when the memory address counters overflow for the first time during acquisition. H/MEMFUL will continue true from then on, no matter how many times the counters go around, until the analyzer is RESET. Thus, the counters indicate when memory has been filled with new data at least once.

6. Clock once more. H/MEMFUL should be high. This indicates indirectly that the Y-counter has been counting correctly.

7. Reset, and set the memory address to 55H (55x and 55y). H/MEMFUL should be low.

8. X-counter is clocked to FFH.

9. X-counter is clocked once more. It should read 00H.

10. Analyzer is clocked to one before the memory is full. Both X and Y counters should be 01H. H/MEMFUL should still be false.

11. Clock once more. H/MEMFUL should be high.

4-33. D/A Converter Adjustment.

After test #2 (ram counters) is run, the DACs are left with +2.117V (+/- 7.0mV) on TP1 and TP2. Adjustments may be made using the procedure in Section 5.

4-34. TEST 3: FAST SAMPLE TEST [0 0 0 0 0 0]

test steps: 1 2 3 4 5 6

4-35. Purpose.

This test verifies that the counters are running, that clocks are getting through the system, and that the fast sample latch (U71B) sets and resets. The following conditions are programmed: fast sample mode is set; glitch chip is programmed to never trigger.

4-36. Test Steps. (Description of software execution)

1. Reset and turn on the Fast Sample Mode. H/MEMFUL should be false.
2. The fast sample latch should be set.
3. Start acquisition. H/MEMFUL should go true.
4. Reset and turn on the Wide Sample Mode/200MHz. H/MEMFUL should be false.
5. The fast sample latch should be reset.
6. Start acquisition. H/MEMFUL should go true.

4-37. D/A Converter Verification.

After test #3 (fast sample) is run TP1 and TP2 should show 0V (+/- 4.5mv). This test is for Verification only. See Section 5 for the adjustment procedure.

4-38. TEST 4: DUAL THRESHOLD MODE [0 0 0 0 0 0 0 0]

test steps: 1 2 3 4 5 6 7

4-39. Purpose.

This test exercises the timing probe, the glitch chip (U27), the two D/A converters (DACs), and the dual threshold latch (U71A) in the Dual Threshold Mode.

4-40. Theory.

In the Dual Threshold Mode, DAC A (U76) sets the lower threshold, using channels 0-3; and DAC B (U78) sets the upper threshold, using channels 4-7.

Since two channels are needed for each probe input, an analyzer with only one acquisition board is reduced to four channels. Only the low order probe inputs--0,1,2,3--are active.

Each of these low order probe inputs comes into the board on two separate channels: probe 0 => channels 0 & 4, probe 1 => channels 1 & 5, probe 2 => channels 2 & 6, and probe 3 => channels 3 & 7.

Since one of the set-up conditions for the PV tests is that the probes are left disconnected and floating near ground, incoming data levels are simulated by varying the DAC thresholds: a HIGH probe input is simulated by a LOW threshold.

The dual threshold mode is set by the dual threshold latch (U71A), which sends HE/DT to the probe bus (J1-22). HE/DT is used to latch the probe pod into the dual threshold and fast sample modes. In both of these modes, only four probe inputs are active.

4-41. Test Steps. (Description of software execution)

1. The dual threshold latch, U71A, is reset.

2. The dual threshold latch is set.

TEST 4: DUAL THRESHOLD MODE (continued)

In each of the next five tests, the DACs are exercised in all of the following ways:

a. Both thresholds are set to maximum (+12.7V): all probe data will be seen as LOW.

b. Both thresholds are set to minimum (-12.8V): all probe data will be seen as HIGH.

c. Upper thresholds are set to +12.7V, and lower thresholds are set to -12.8V.

d. Upper thresholds are set to -12.8V, and lower thresholds are set to +12.7V.

e. DACs are set back to condition "a".

3. Program the glitch chip to always trigger. XE/TRIG should be true under all the above conditions.

4. Program the glitch chip to trigger only on a HIGH. XE/TRIG should be true only under condition b.

5. Program the glitch chip to trigger only on a selected middle level. Trigger should occur only under condition d.

6. Program the glitch chip to trigger only on a LOW. Trigger should occur only under condition a.

7. This step checks that XE/TRIG and XE/TRIGPOL to the status register U82 were the correct polarity in all the above tests.

4-42. D/A Converter Adjustment Verification.

After test #4 (dual threshold) is run, the DACs are left with TP1=+1.666 and TP2=-1.666 (with the probes disconnected). THIS TEST IS FOR VERIFICATION ONLY!. Adjustments are made using test #1 and test #2.

4-43. TEST 5: GLITCH MODE TEST

	[0 0 0 0 0] [0 0 0 0 0]
test steps:	1 2 3 4 5 6 7 8 9 10

4-44. Theory.

Glitches are defined as two or more transitions between sample times.

When the DAC thresholds are set HIGH or LOW, it makes inputs from the floating probes appear to be at the opposite level. In this test the DAC thresholds are "wiggled" between clock edges to create glitches.

4-45. Purpose.

This test exercises the probe and glitch chip (U27) in the glitch mode. The test verifies a trigger (XE/TRIG at U82-4) under the following conditions:

a. The sample clock begins with a leading edge. That is, the first sample time corresponds to a leading clock edge.

b. The sample clock begins with a trailing edge.

c. Glitch transitions, between sample times, begin with a leading edge.

d. Glitch transitions begin with a trailing edge.

e. Two glitch transitions occur between clock edges.

f. Three glitch transitions occur between clock edges.

4-46. Test Steps. (Description of software execution)

In the first bracket group, the sample clock alternates HIGH-LOW-HIGH. Each test covers a sequence, starting and ending with the the clock HIGH.

1. The Glitch Mode is set. No trigger (XE/TRIG=1 at U82-4) should occur on a normal data transition.

2. Two glitch transitions, beginning with a falling edge, occur between samples: XE/TRIG = 1.

3. Three glitch transitions occur, beginning with a falling edge: XE/TRIG=1.

4. Two glitch transitions occur, beginning with a rising edge: XE/TRIG=1.

5. Three glitch transitions occur, beginning with a rising edge: XE/TRIG=1.

GLITCH MODE TEST (continued)

In the second bracket group, the clock alternates LOW-HIGH-LOW.

6. No trigger on a normal data transition.

7. XE/TRIG = 1 after two transitions which begin on a falling edge.

8. Triggers on three transitions which begin on a falling edge.

9. Triggers on two transitions which begin on a rising edge.

10. Triggers on three transitions which begin on a rising edge.

4-47. D/A Converter Adjustment Verification.

After test #5 (glitch mode) is run, the DACs are left with TP1=-1.666 and TP2=+1.666 (with the probes disconnected). THIS TEST IS FOR VERIFICATION ONLY! Adjustments are made using test #1 and test #2.

4-48. TEST 6: DACS TRIGGER TEST

	[0 0 0 0 0 0 0 0 0 0 0 0 0 0]
test steps:	1 2 3 4 5 6 7 8 9 10 11 12 13 14

4-49. Purpose.

This test checks the D/A converters, the probes, and the glitch chip.

4-50. Test Steps. (Description of software execution)

In each of the following tests, the DACs are exercised as in the DUAL THRESHOLD TEST above.

1. The glitch chip is programmed to always trigger. XE/TRIG should be true under all the conditions given in the DUAL THRESHOLD TEST.

2-9. The glitch chip is programmed so that one channel at a time will never trigger. In other words, a "never-trigger" is walked through all the channels, and the thresholds are exercised under all conditions. XE/TRIG (U82-4) should be false for all these tests.

10. The glitch chip is programmed so that all channels will trigger on a HIGH. XE/TRIG should be true only under condition b, as given in the Dual Threshold Test.

11. The glitch chip is programmed so that all channels will trigger on a LOW. XE/TRIG should be true only under condition a.

12. Channels 0-3 are programmed with a LOW threshold, and channels 4-7 are programmed with a HIGH threshold. XE/TRIG should be true only under conditon c.

13. Channels 0-3 are programmed with a HIGH threshold, and channels 47 are programmed with a LOW threshold. XE/TRIG should be true only under condition d.

14. For all the above tests, XE/TRIG to the timing bus was true at the correct times.

4-51. TEST 7: CHECKER BOARD

test steps:	1	2
	[0 0 0 0 0 0 0 0]	[0 0 0 0 0 0 0 0]
RAM channels:	0 7 1 6 2 5 3 4	0 7 1 6 2 5 3 4

4-52. Purpose.

This test checks the RAMs and the output stage of the encoders by loading two alternating patterns of HIGHs and LOWs into each memory channel, and then verifying. The patterns are generated by the pattern generator inside the encoders.

A memory channel consists of the four RAMs loaded by a particular probe channel in the Wide Sample Mode.

Each "0" in a bracket corresponds to a memory channel in the following order: 0,7,1,6,2,5,3,4.

4-53. Test Steps. (Description of software execution)

1. Load 01010101... into memory channels 1,2,5,6; and 10101010... into memory channels 0,3,4,7. The RAM looks like one big checker board. All locations are tested.

2. Load 10101010... into memory channels 1,2,5,6; and 010101... into channels 0,3,4,7. This is the same as the previous test except that all bits are complemented.

4-54. TEST 8: RAM FILLED

test steps:	1	2
	[0 0 0 0 0 0 0 0]	[0 0 0 0 0 0 0 0]
RAM channels:	0 7 1 6 2 5 3 4	0 7 1 6 2 5 3 4

4-55. Purpose.

This test checks the acquisition RAM by loading in all HIGHs or all LOWs, and then verifying.

A "memory channel" consists of four RAMs that correspond to a particular probe channel in Wide Sample Mode.

Each "0" in a bracket corresponds to a memory channel in the following order: 0,7,1,6,2,5,3,4.

4-56. Test Steps. (Description of software execution)

1. By programming the DAC thresholds for a maximum positive value, load all LOWs into memory channels 0-7, and verify. All locations are tested.

2. By programming the DACs with a maximum negative threshold, load all HIGHs into RAM channels 0-7. All locations are tested.

4-57. TEST 9: GALLOPING ONE'S [00000000][00000000]
[00000000][00000000]
[00000000][00000000]
[00000000][00000000]

This test checks address lines, rather than memory itself. The bracket GROUPs represent address lines, or bits. (Since the X and Y addresses are identical for this test, only eight address bits, corresponding to a 16-bit location, are needed.) The "0's" in each group represent memory channels in the order: 0,7,1,6,2,5,3,4. Thus:

A0 A1
[chs.0,7,1,6,2,5,3,4] [chs.0,7,1,6,2,5,3,4]

A2 A3
[chs.0,7,1,6,2,5,3,4] [chs.0,7,1,6,2,5,3,4]

A4 A5
[chs.0,7,1,6,2,5,3,4] [chs.0,7,1,6,2,5,3,4]

A6 A7
[chs.0,7,1,6,2,5,3,4] [chs.0,7,1,6,2,5,3,4]

4-58. Procedure used by the software in this test.

After clearing memory, load FFFFH into the same 16-bit address in all channels. Read that location in each channel. Then read the memory. If only the location corresponding to the exercised address bit contains FFFFH, no address lines are open or shorted.

Addresses are chosen in the following way: One address bit at a time is first made LOW, then HIGH. The corresponding power-of-two addresses will then be: 01H,...,08H and FEH,...,7FH, as follows:

HEX ADDR.	ADDR. LINES A7	A6	A5	A4	A3	A2	A1	A0	CHANNELS: 0,7,1,6,2,5,3,4
01	L	L	L	L	L	L	L	H	EACH
02	L	L	L	L	L	L	H	L	EACH
04	L	L	L	L	L	H	L	L	EACH
08	L	L	L	L	H	L	L	L	EACH
10	L	L	L	H	L	L	L	L	EACH
20	L	L	H	L	L	L	L	L	EACH
40	L	H	L	L	L	L	L	L	EACH
80	H	L	L	L	L	L	L	L	EACH
and then:									
FE	H	H	H	H	H	H	H	L	EACH
FD	H	H	H	H	H	H	L	H	EACH
FB	H	H	H	H	H	L	H	H	EACH
F7	H	H	H	H	L	H	H	H	EACH
EF	H	H	H	L	H	H	H	H	EACH
DF	H	H	L	H	H	H	H	H	EACH
BF	H	L	H	H	H	H	H	H	EACH
7F	L	H	H	H	H	H	H	H	EACH

GALLOPING ONE'S (continued)

For example, when bit A0 is exercised:

a. Address 01H should be the only location in all channels to contain FFFFH.

b. Then address FEH should be the only location in all channels to contain FFFFH.

c. If both of these conditions are true, the first bracket will contain only "0's".

The following inferences can be made from this test:

a. If the selected address does not contain FFFFH, that address line is open and will be indicated by one or more "O"s instead of "0's".

b. Two or more address lines are shorted if any of the other addresses also contain FFFFH. For example, when exercising 01H, if 09H also contains FFFFH, then A0 is shorted to A3. This will cause "1" to appear on all channels of those two address lines, eg: [11111111] [11111111].

c. A RAM internal short, after the input buffers, may appear as a "+" on one of the channels, eg: [0000+000], indicating channel 2. Since a memory channel is composed of four RAMs, the problem can then be narrowed down to one of four RAMs.

d. The encoders or glitch chip may also cause failures to occur in this test, even though previous tests have passed. For example, if both the X and Y addresses are the same, except for A0, and the signatures are correct on the address lines, check the signatures on the outputs of the RAMs. If these are correct, but one or more of the input data line signatures are wrong, the problem is likely to be the encoder for that channel.

4-59. SUPPLEMENTARY BOARD ID TEST

4-60. The board ID circuits have stable signatures when "opt_test" is pressed. If the Timing Boards are not then listed on the screen, the ID circuitry is not working. Check the ID circuitry signatures (U75, U82).

4-61. SUPPLEMENTARY PV SKEW TEST.

4-62. The Skew Test is a supplementary PV test which checks the skew between channels.

4-63. Skew is the difference in delay between any two channels.

4-64. There are two stages to the skew test. In the first stage one of the eight probe channels is chosen as a reference channel, and either one or all of the other seven channels is measured for skew against the reference.

4-65. The second stage of the test is done in the fast sample mode. This test measures the amount of skew in the two channels paired in the fast sample mode. If the first stage test measured 0.0 ns skew for these two channels, the skew now measured in the Fast Sample Delay Line test should be exactly 2.5 ns, which is the delay caused by the fast sample delay line.

4-66. To access the Skew Test, perform the following:

1. Press "opt_test". RETURN.
2. Type in the slot number for either the timing control or acquisition boards. RETURN.
3. Type in "skew". RETURN.
4. The screen should now display the setup information for the skew test as shown in figure 4-2.

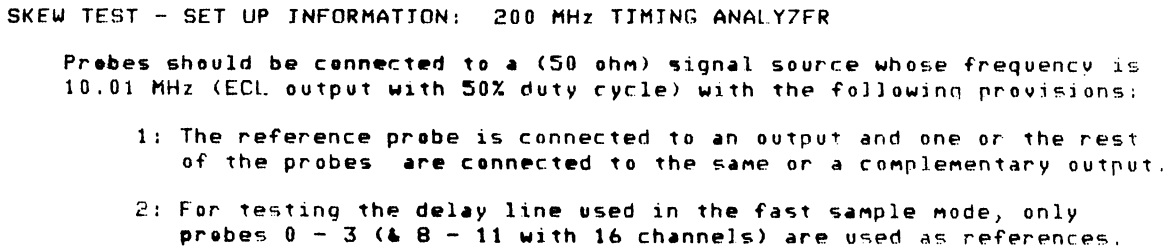

Figure 4-2. Skew Test Setup

4-67. To perform the first skew test:

1. Press "skew_test".
2. You may now choose a reference channel, and then press RETURN.
3. If you don't choose a reference channel, the system will automatically select channel 0.
4. When you press RETURN, the display will show the skew of all the other channels with respect to the reference channel, using both positive and negative edges. (SEE FIGURE 4-3). The test cycles 25 times and lasts about one and three-quarter minutes.
5. The amount of skew shown in this test when the probe is connected properly according to the setup conditions shown in the first display should be 1.5 ns typical.

200 MHz TIMING: Nano Seconds of SKEW - with respect to
POSITIVE EDGES: NEGATIVE EDGES: of the reference channel's signal

CHANNEL:	0	ref	ref
	1	0.0ns	0.0ns
	2	0.0ns	0.0ns
	3	0.0ns	0.0ns
	4	0.0ns	0.0ns
	5	0.0ns	0.0ns
	6	0.0ns	0.0ns
	7	0.0ns	0.0ns

Figure 4-3. First Skew Test

4-68. To perform the second skew test:

1. Press "fast_samp"

2. The screen will display "fast_sample_delay _line _test".

3. You may now either choose a reference channel, or let the system default to channel 0.

4. Press RETURN. The screen will show the amount of skew in the channel paired in the fast sample mode with the reference channel. For example, if channel 0 is the reference channel, channel 4 will be the other channel used in the measurement because channel 4 is paired with channel 0 in the fast sample mode. Similarly, channels 1 and 5, channels 2 and 6, and channels 3 and 7 will be paired. (SEE FIGURE 4-4).

5. The amount of skew shown in this test when the probe is connected properly according to the setup conditions shown in the first display should be 2.5 ns **typical, which is the length of the delay line.**

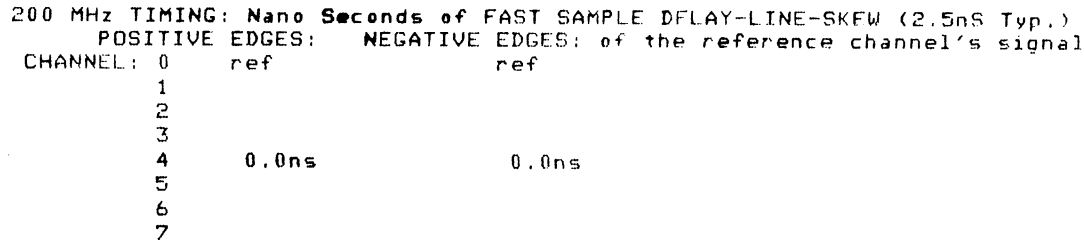

Figure 4-4. Second Skew Test

4-69. PV SOFTKEY SEQUENCE.

The following figures (4-5 to 4-13) show the softkey sequence needed to run a single PV test repeatedly for signature analysis. Each PV test corresponds to one signature loop. The signature lists are given after the figures.

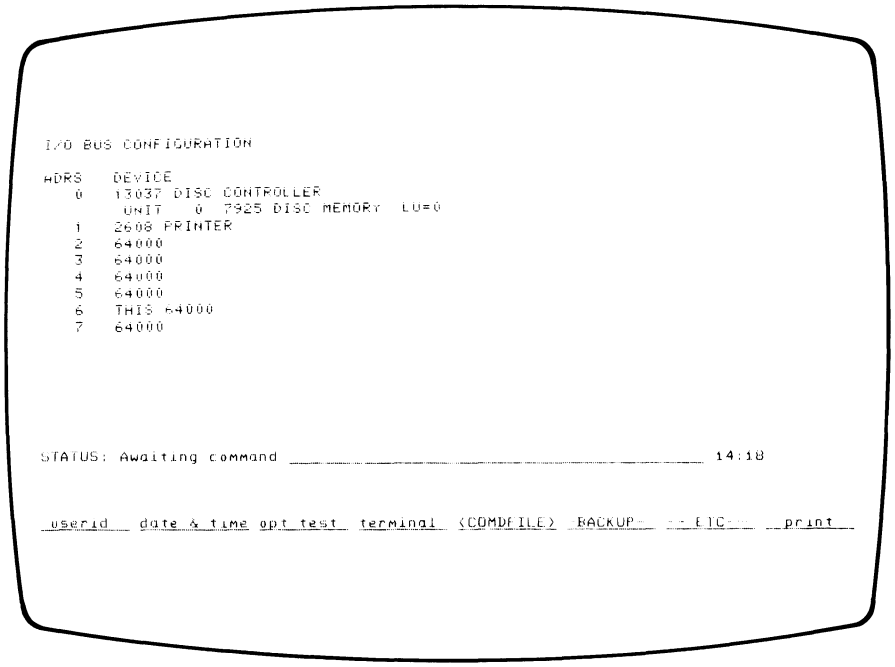

Figure 4-5. Press "opt_test".

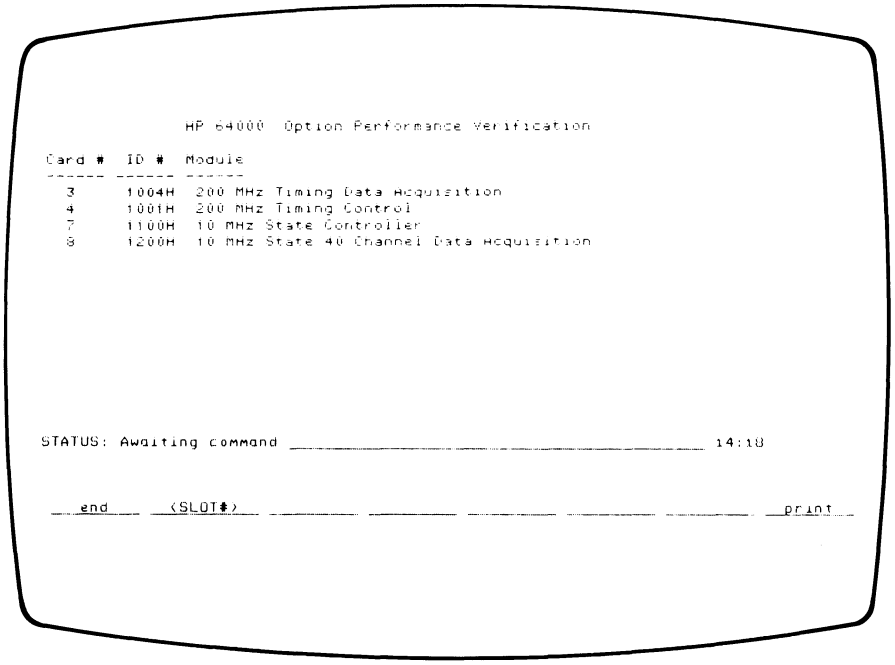

Figure 4-6. Type the slot number.

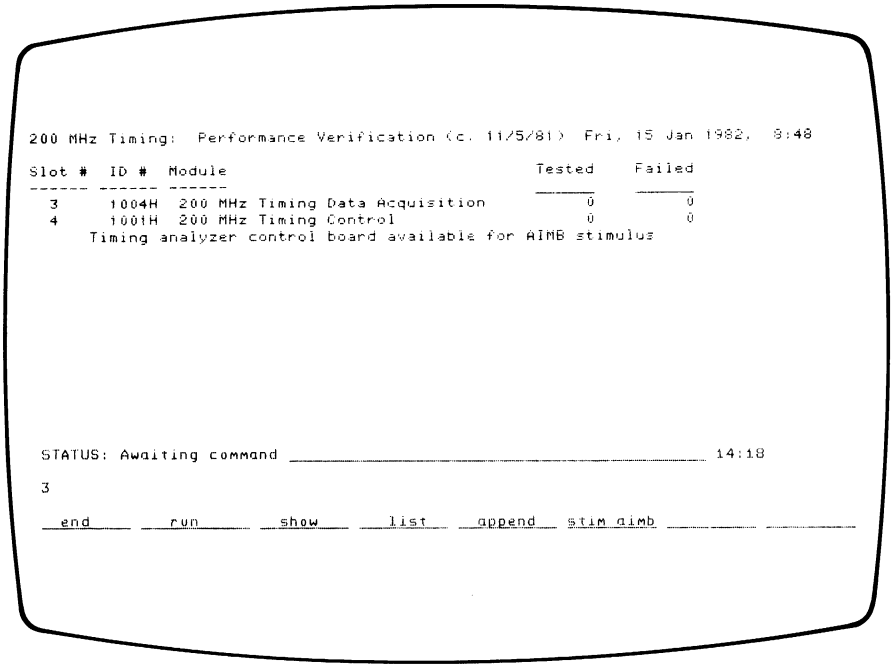

Figure 4-7. Press "run".

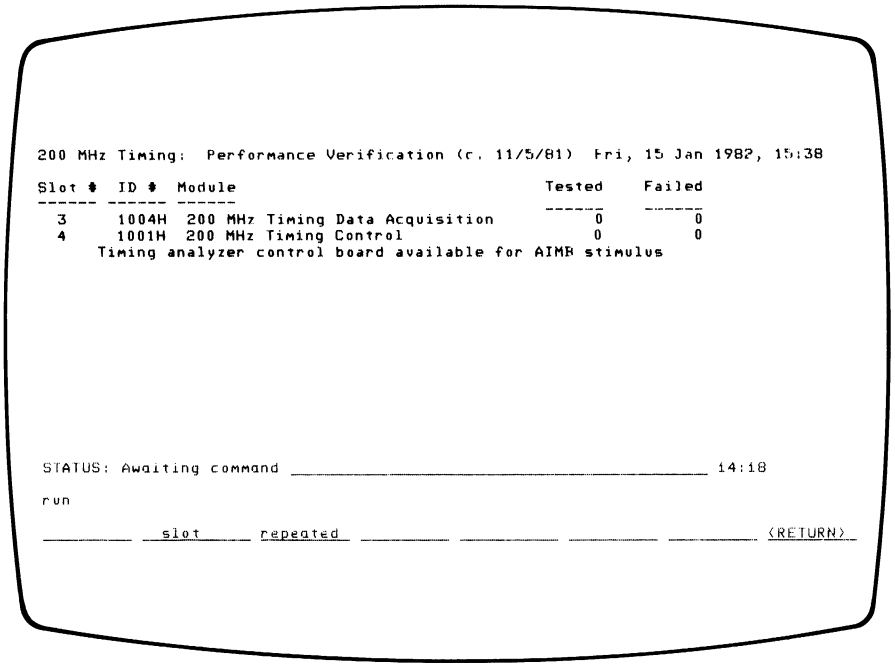

Figure 4-8. Press "slot".

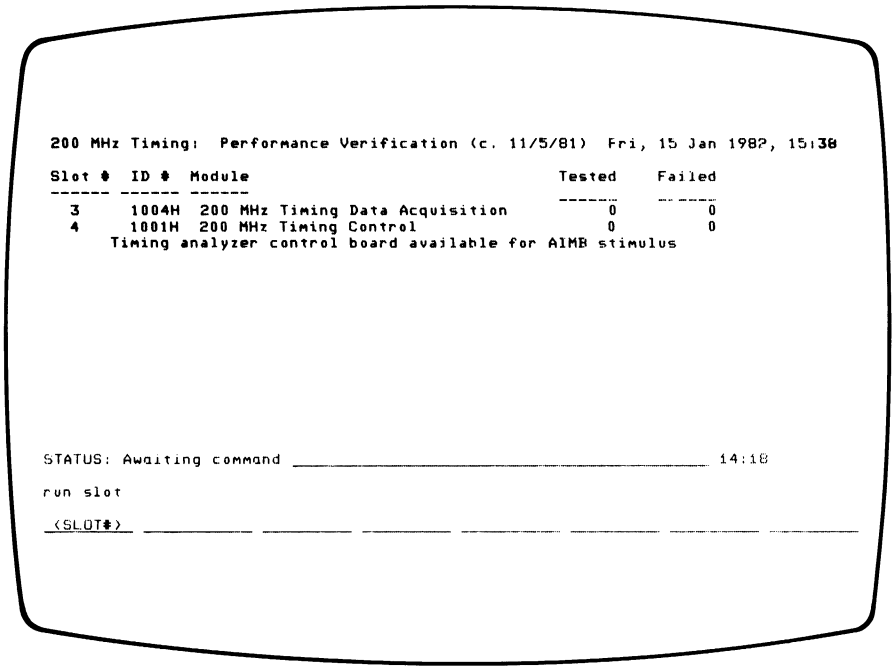

Figure 4-9. Type the slot number.

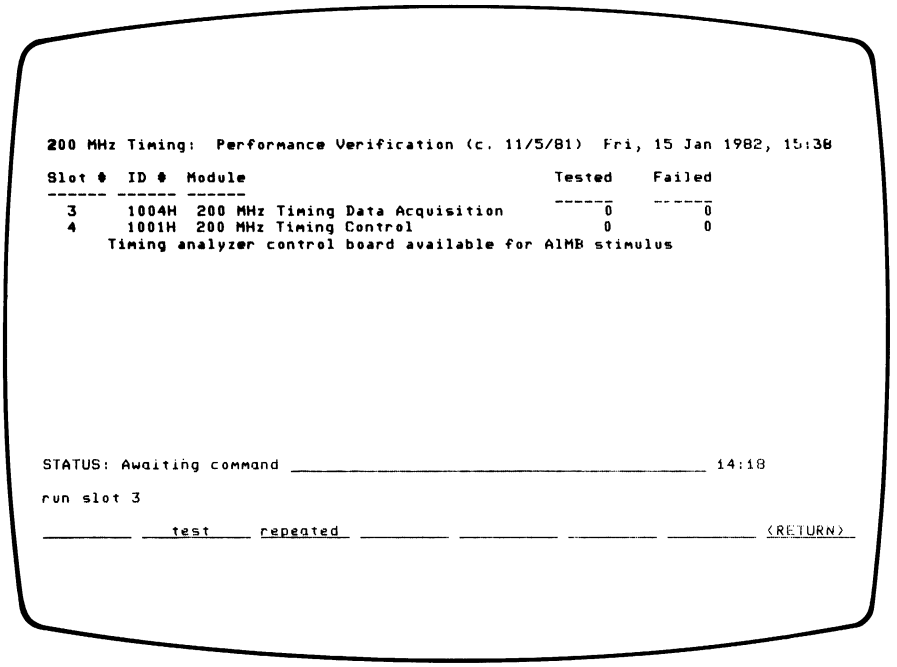

Figure 4-10. Press "test".

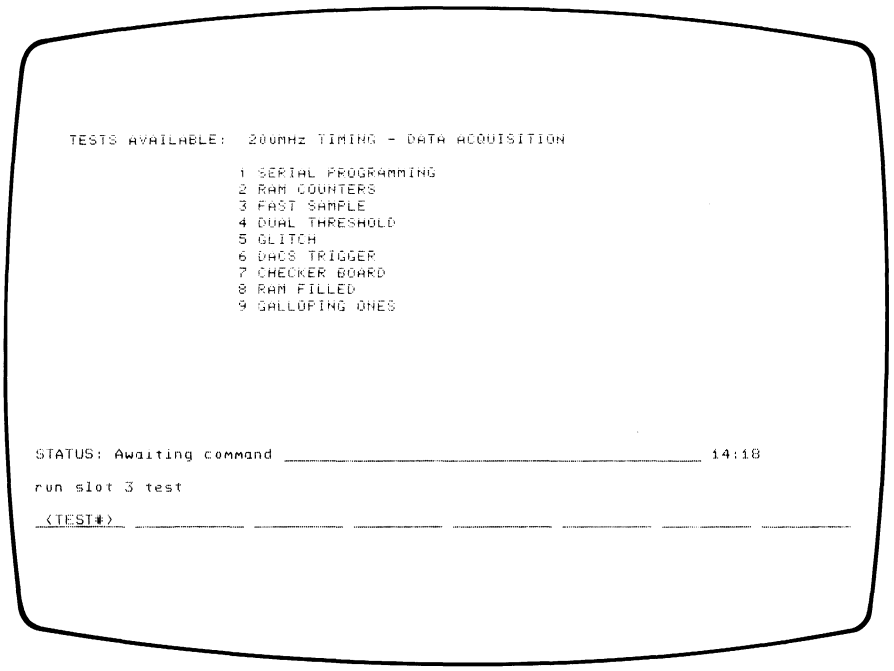

Figure 4-11. Type the test number.

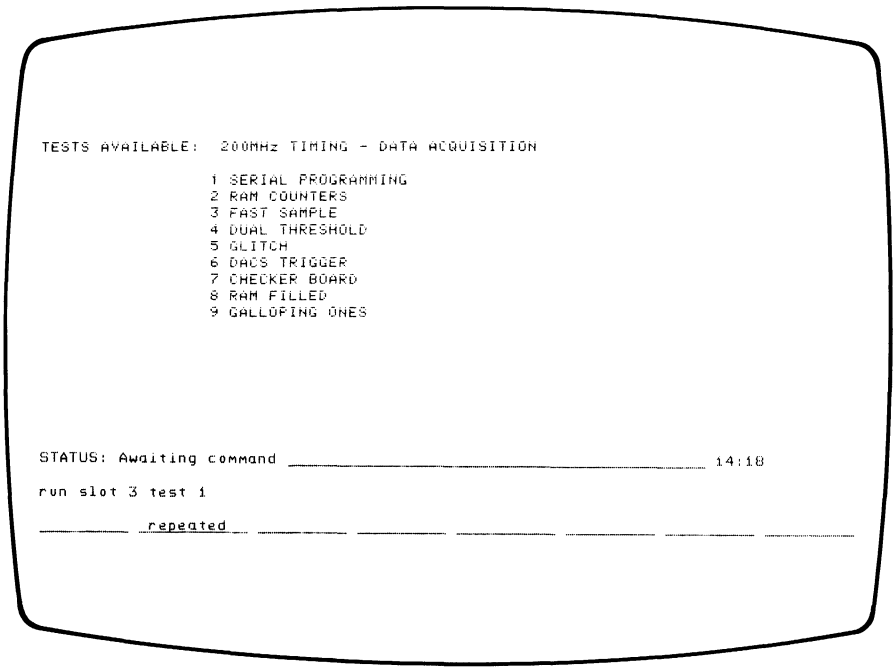

Figure 4-12. Press "repeated".

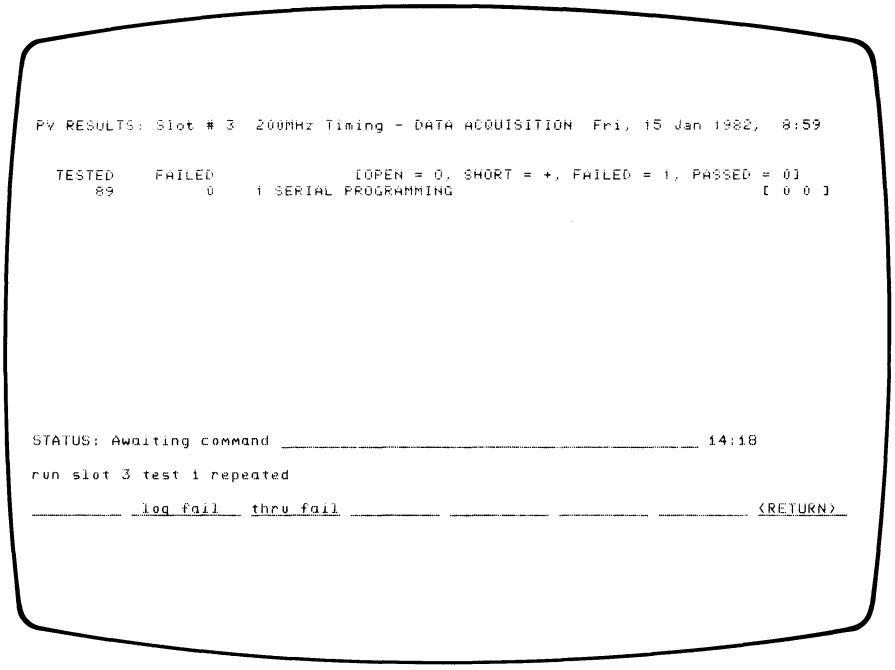

Figure 4-13. Press [RETURN].

4-70. SIGNATURE ANALYSIS.

4-71. The following 9 signature loops correspond to the previously given performance verification tests. That is, if a PV test fails, run the signature loop corresponding to that test. For example, if one of the test steps for TEST 1: SERIAL PROGRAMMING shows a "1" instead of a "0" in the bracket, look at the signatures for LOOP 1. In order to take the signatures, run TEST 1 repeatedly, using the procedure illustrated by the above figures (4-2 to 4-10).

NOTES

SECTION V

ADJUSTMENTS

5-1. INTRODUCTION.

5-2. This section describes adjustments and checks required to return the instrument to peak operating capability after repairs have been made.

5-3. SAFETY REQUIREMENTS.

5-4. Although this instrument has been designed in accordance with international safety standards, general safety precautions must be observed during all phases of operation, service, and repair of the instrument. Failure to comply with precautions listed in the Safety Summary at the front of this manual or with specific warnings given throughout the manual could result in serious injury or death or damage to equipment. Service adjustments should be performed only by qualified service personnel.

5-5. EQUIPMENT REQUIRED.

5-6. a. Digital voltmeter with at least four-place accuracy, such as the HP 3466A DVM, or equivalent.

b. Nonconductive alignment tool.

c. Shorting clip lead.

5-7. DESCRIPTION.

5-8. The 64602A timing acquisition board has only three adjustments, one for DAC negative full-scale, and two for DAC positive full-scale.

5-9. PV tests 1 and 2 are used to make the DAC adjustments.

5-10. KEYBOARD SETUP.

5-11. Use the following steps to access the 64602A Acquisition Board PV tests, which are used to make the DAC adjustments:

a. With the operating system initialized and awaiting a command, press the softkey labeled "opt_test" (you may have to keep pressing the "etc" softkey until you see "opt_test" on the screen).
b. Press [RETURN]. You should see a listing of all the optional boards that are present in your mainframe, along with their slot numbers.
c. Type in the Timing Acquisition Board slot number.
d. Press [RETURN].
e. Press softkey "run".
f. Press softkey "slot".
g. Type in the Timing Acquisition Board slot number.
h. Press softkey "test". The screen will now list all the Timing Acquisition Board PV tests.
i. Type in the number of the test you wish to run. (For the acquisition board adjustments, use tests 1 and 2).
j. Press [RETURN].

5-12. DACS NEGATIVE FULL-SCALE ADJUSTMENT.

5-13.

a. Disconnect the timing probe from the acquisition board before making this adjustment.

b. If it has not already been done, press softkey "opt_test", [RETURN], and then the following softkeys in sequence: "run slot (type in acq. bd. slot) test 1".

c. Press [RETURN]

d. Connect the ground lead of the DVM to the GND test point located on the upper middle part of the board.

e. Short TP1 to TP2 with the clip lead.

f. Connect the V-ohms lead of the DVM to TP1.

g. Adjust -FS (R2) for -2.133V +/- 0.5mV at TP1.

h. Remove the clip lead shorting TP1 to TP2.

i. Check that TP1 and TP2 are within 4.0mv of each other; if they are they are not, suspect U77 (op-amp) within the DAC circuitry.

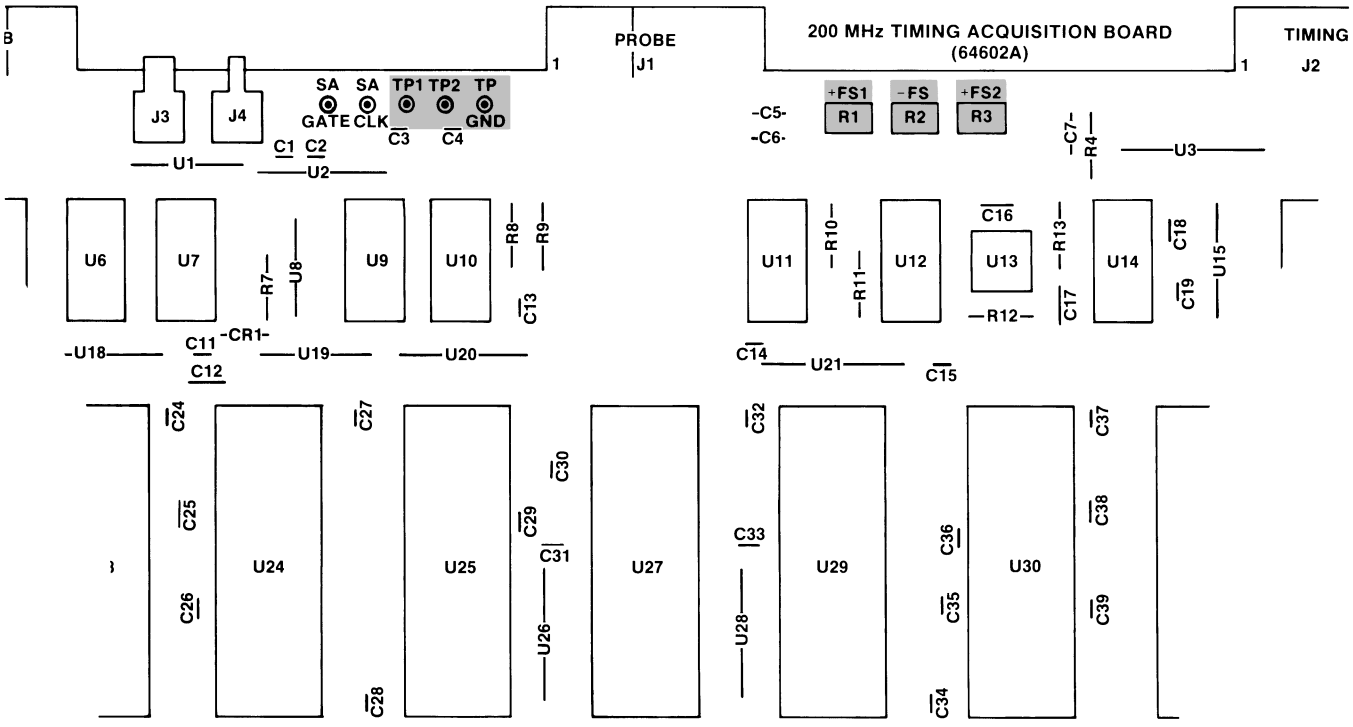

Figure 5-1. Adjustments

5-14. DACS POSITIVE FULL-SCALE ADJUSTMENT.

5-15. a. Disconnect the timing probe from the acquisition board before making this adjustment.

b. If it has not already been done, press softkey "opt_test", [RETURN], and then the following softkeys in sequence: "run slot (type in acq. bd. slot) test 2".

c. Press [RETURN].

d. Connect the ground lead of the DVM to the GND testpoint located on located on the upper middle part of the board.

e. Connect the V-ohms lead of the DVM to TP1.

f. Adjust +FS1 (R1) for +2.117V +/- 0.5mV at TP1.

g. Connect the V-ohms lead of the DVM to TP2.

h. Adjust +FS2 (R3) for +2.117V +/- 0.5mV at TP2.

NOTES

SECTION VI

REPLACEABLE PARTS

6-1. INTRODUCTION.

6-2. This section contains information for ordering parts. Table 6-1 lists abbreviations used in the parts list and throughout the manual. Table 6-2 lists all replaceable parts in reference designator order. Table 6-3 contains the names and addresses that correspond to the manufacturers' five-digit code numbers.

6-3. ABBREVIATIONS.

6-4. Table 6-1 lists abbreviations used in the parts list, the schematics and throughout the manual. In some cases, two forms of the abbreviation are used: one all in capital letters, and one partial or no capitals. This occurs because the abbreviations in the parts list are always capitals. However, in the schematics and other parts of the manual, other abbreviation forms are used with both lower-case and upper-case letters.

6-5. REPLACEABLE PARTS LIST.

6-6. Table 6-2 is the list of replaceable parts and is organized as follows:

a. Chassis-mounted parts are in alphanumerical order by reference designation.

b. Electrical assemblies and their components in alphanumerical order by reference designation.

c. Miscellaneous parts.

The information given for each part consists of the following:

a. The Hewlett-Packard part number and the check digit.

b. The total quantity (Qty) in the instrument.

c. The description of the part.

d. A five-digit code that indicates the manufacturer.

e. The manufacturer's part number.

The total quantity for each part is given only once, at the first appearance of the part number in the list.

6-7. ORDERING INFORMATION.

6-8. To order a part listed in the replaceable parts table, quote the Hewlett-Packard part number and check digit, indicate the quantity required, and address the order to the nearest Hewlett-Packard office.

6-9. To order a part that is not listed in the replaceable parts table, include the instrument model number, instrument repair number, the description and function of the part, and the number of parts required. Address the order to the nearest Hewlett-Packard office.

6-10. SPARE PARTS KIT.

6-11. A service kit is available. To order, please contact your local sales and service representative.

6-12. DIRECT MAIL ORDER SYSTEM.

6-13. Within the USA, Hewlett-Packard can supply parts through a direct mail order system. Advantages of using the system are as follows:

a. Direct ordering and shipment from the HP Parts Center in Mountain View, California.

b. No maximum or minimum on any mail order (there is a minimum order amount, for parts ordered through a local HP office when the orders require billing and invoicing).

c. Prepaid transportation (there is a small handling charge for each order).

d. No invoices - to provide these advantages, a check or money order must accompany each order.

6-14. Mail-order forms and specific ordering information are available through your local HP office. Addresses and phone numbers are located at the back of this manual.

NOTES

SECTION VII

MANUAL CHANGES

7-1. This section normally contains information for backdating this manual for models with repair numbers prior to the one shown on the title page. This edition includes information for the first repair number, so there would ordinarily be no backdating material. However some of the earliest customers received a Revision A board, which is somewhat different from the presently shipped Revision B board.

7-2. The Rev A board only, has a small pair of soldered jumpers at the very bottom left-hand corner (when viewing from the component side). Both A and B on these jumpers must be connected to 1, as shown.

7-3. Two 2.2 uF capacitors were changed to .01 uF capacitors. On the REV A component locator, shown below, these were C26 and C36. In comparing this old locator with the present one, you will notice the positions of the capacitors next to the encoders have changed. C26 has become C24 and is connected between +5V and ground. C36 is unconnected. A listing of the .01 uF capacitors next to the encoders (U22-27, U29-32) on the REV A board is given:

C22,23,25,26,28,29,34-36,38-40 are connected from +5V to ground.

C24,27,30,32,37,41 are connected from -3.25V to ground.

C31,33 are connected from -5.2V to ground.

7-4. The capacitor connections on the REV B board are given on Service Sheet 1 of Section 8. Capacitor positions for the REV B board are shown on the component locators in this manual.

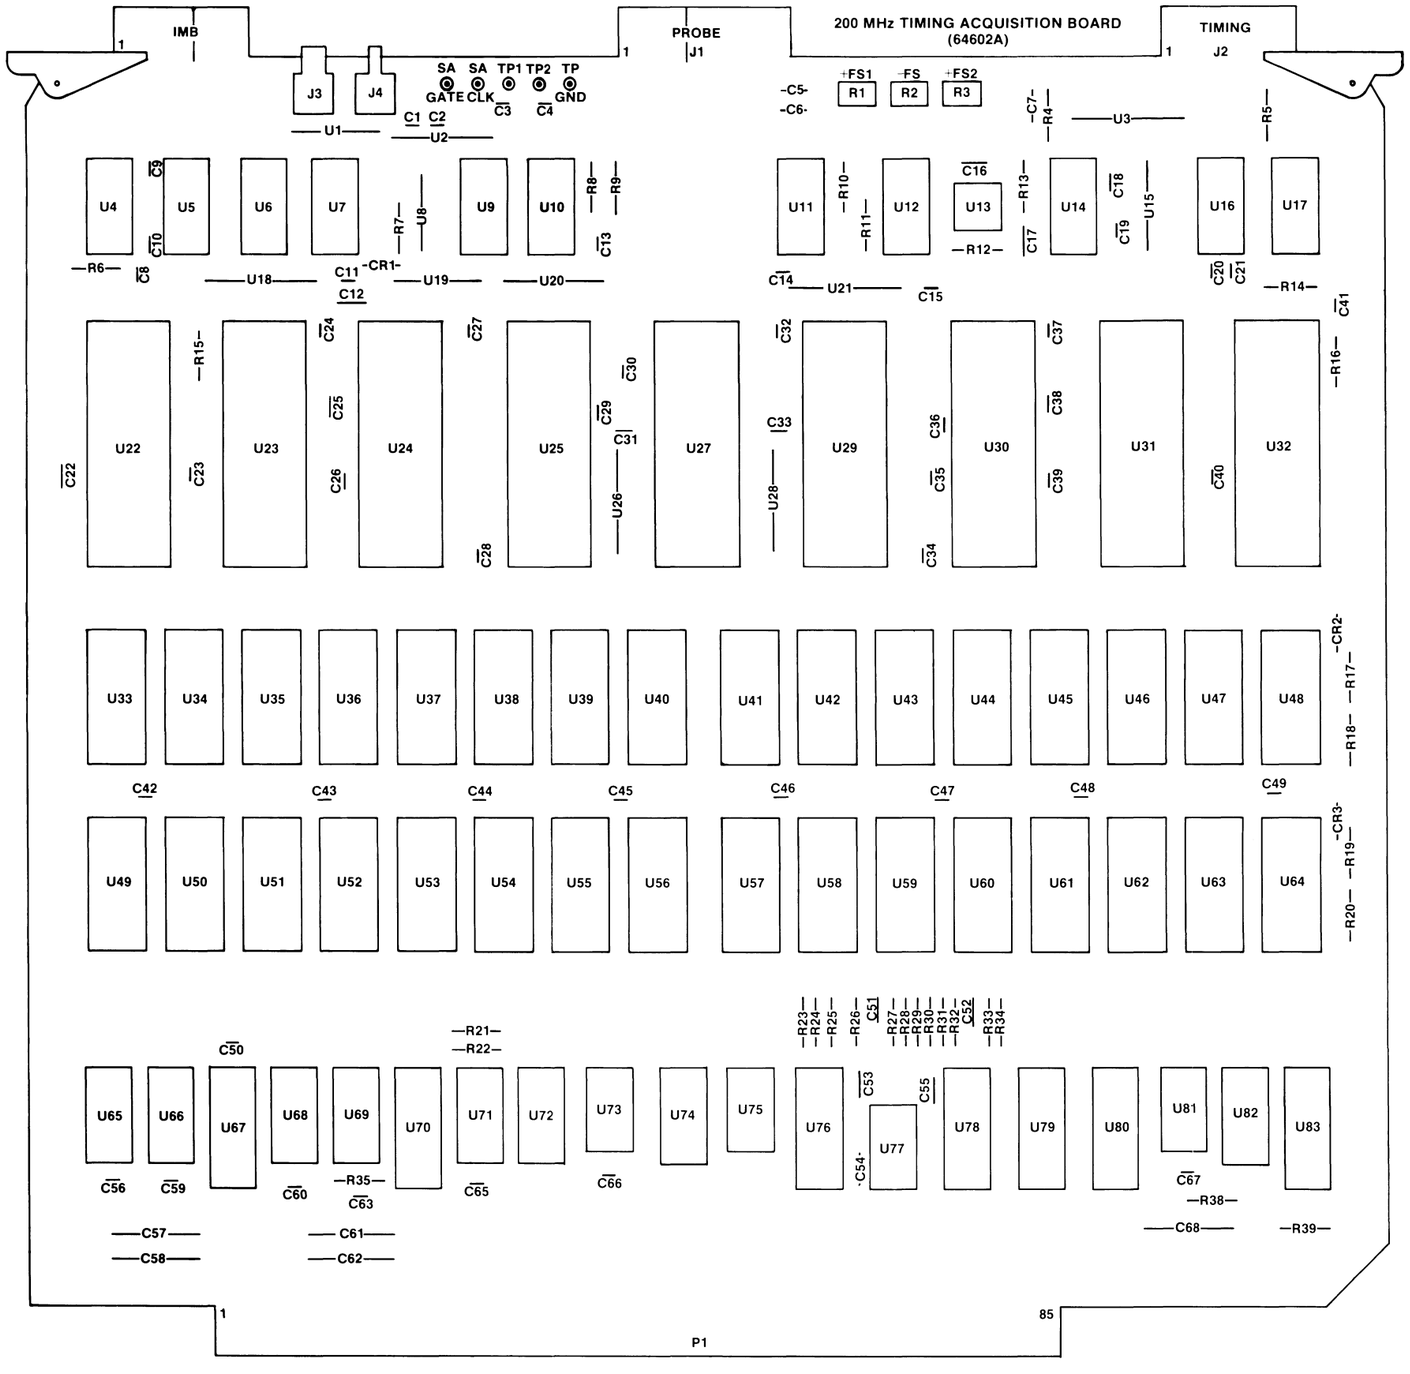

Figure 7-1. REV A Component Locator.

SECTION VIII

THEORY AND SCHEMATICS

CAUTION

THE GLITCH (U27) AND ENCODER (U22-25, U29-32) CHIPS ARE VERY SENSITIVE TO STATIC. THEY SHOULD BE LEFT IN CONDUCTIVE FOAM UNTIL INSTALLATION. GROUNDING STRAPS AND A GROUNDED WORK STATION ARE RECOMMENDED WHEN HANDLING THE ICS.

8-1. INTRODUCTION.

8-2. This section contains block diagrams, mnemonic tables, schematics and theory. Some theory is also given with the PV test descriptions in SECTION 4.

8-3. There are four modes of timing analyzer operation: Wide Channel, in which eight channels are sampled at a 200MHz rate and stored as 4096 bits of serial data per channel; 4-Channel Glitch Capture Mode which identifies multiple transitions between clock pulses, with both 4K of data and 4K of glitch information stored per channel; 4-Channel Dual Threshold Mode in which four channels are compared to two thresholds, and 4K is stored for each threshold on each channel; 4-Channel Fast Sample Mode in which four channels are sampled in a time-interleaved fashion for an effective 400MHz sample rate, and 8K of data is stored for each channel.

8-4. PROBE THEORY.

8-5. The probe bus passes data from the system under test to the analyzer via the 64604A timing probe. The probe compares the voltages on inputs 0-3 and 4-7 to a corresponding pair of d.c. thresholds from two D/A converters on the acquisition board. The DACs supply middle thresholds to the probe in the wide sample, glitch, and fast sample modes. In the dual threshold mode the DACs supply both upper and lower thresholds.

8-6. GLITCH CHIP. (Figs. 8-1, 8-8)

8-7. The glitch chip (U27) receives timing data from the probe. The glitch chip contains a 20-bit holding register which is programmed by the mainframe for a specified trigger pattern and mode of operation, as follows:

Bit 1: Chooses recognition of either pattern, or pattern complement.
Bit 2: Chooses synchronous triggering, in which the pattern is compared with already sampled data, rather than with the asynchronous incoming data. This is used for glitch triggering, which is by definition synchronous, ie, referenced to sample times.
Bit 3: Chooses either data sampling from all probes, or, in the glitch mode, from only the four low-order probes (0-3), which are then used for both data and glitch information.
Bit 4: Don't care.
Bits 5-20: Each pair of bits defines the trigger condition on a different channel, as follows:

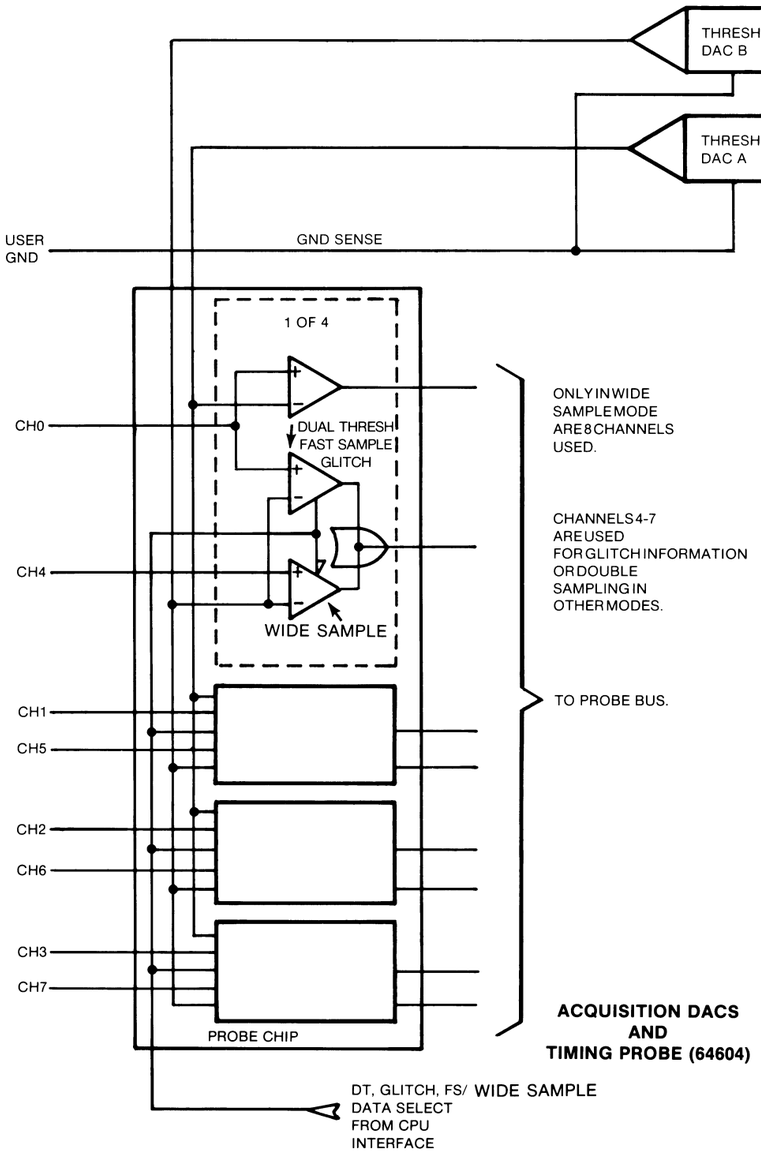
A	B	
0	0	Always trigger, ie, don't care.
0	1	Trigger on a high signal.
1	0	Trigger on a low signal.
1	1	Never trigger, ie, not don't care.

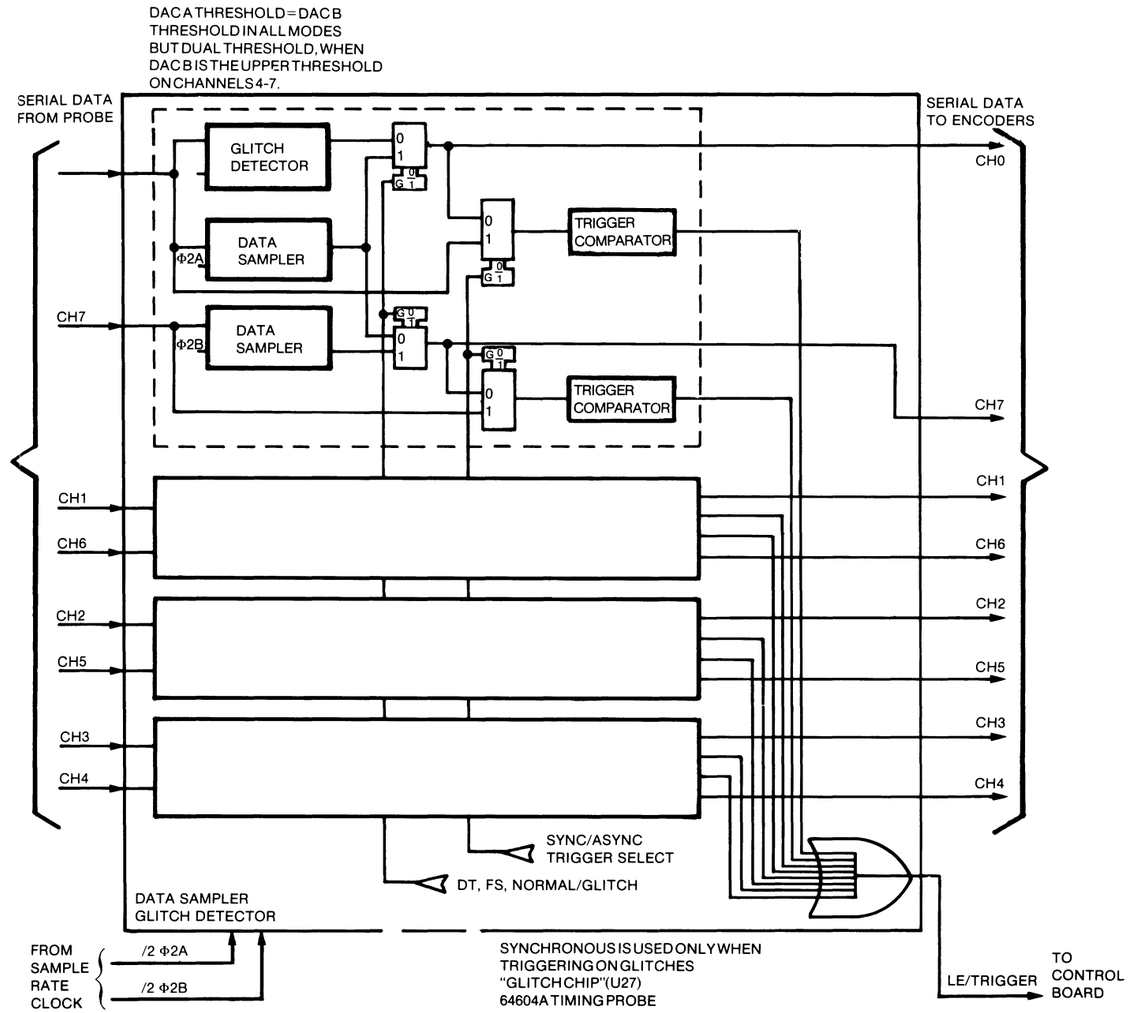
8-8. The glitch chip samples incoming probe data on both edges of the sample clock from the analyzer Control Board. Since both clock edges are used, at the 200MHz maximum sample rate the clock need only be 100MHz. Two pairs of complementary clock signals go into the glitch chip: HE/phi2A, LE/phi2A, HE/phi2B, and LE/phi2B. The "A" clocks differ from each other by 180 degrees, as do the "B" clocks. "A" and "B" clocks are identical except in the Fast Sample Mode, when the "B" clock is delayed by 2.5ns to double the number of sample edges.

8-9. In Fast Sample Mode the control bit to the probe is set, as in dual threshold mode, to doubly compare channels 0-3; but now both threshold voltages are set to the same value. This produces two outputs per channel; and with four separate clock sampling times instead of two, the sample rate is effectively 400MHz.

8-10. In Dual Threshold Mode a control bit to the probe connects the Ch. 0-3 inputs to two comparators. Each of the four inputs is compared to two thresholds from the acquisition board D/A converters. The lower threshold comparisons come into the glitch chip on channels 0-3, and the upper ones on channels 4-7. Software unscrambles the four pairs of data streams into a 3-level signal on four channels--high, middle, and low.

8-11. In Glitch Mode the glitch chip ignores data on channels 4-7 but performs normal sampling plus glitch capture on channels 0-3. Glitches are detected by looking for transitions which conflict with sampled data, such as positive-then-negative transitions after the data was found to be low during the previous sample time.





GLITCH CHIP U27

Figure 8-1.
64604A Probe & the "Glitch Chip" Block Diagram

GLITCH CHIP (continued)

8-12. Since a glitch is by definition a synchronous event--an event bounded by sampling times--triggering on a glitch must be synchronous also. Triggering then occurs only with reference to sample times. When glitches are to be captured only, and not used for triggering, the pattern recognition circuitry is left in its asynchronous mode. Triggering then occurs whenever incoming data conforms to the specified pattern, regardless of whether or not this happens at sample time. The glitch and data information for each of the four channels is processed by the glitch chip as two separate channels would be in the wide channel mode, and the software recombines them into one channel with both glitch and data attributes.

8-13. When the glitch chip finds a match between its pattern and the data on all channels, it will emit an active Low trigger signal, LE/TRIG, for the duration of the match, or until it is reset. XE/TRIG, derived from LE/TRIG, may be programmed High or Low true by the trigger polarity signal, XE/TRIGPOL. A High trigger is used in ANDing a High trigger from another acquisition board; Low triggers are used for ORing. Trigger polarity can also determine whether transition triggering will occur on an "entering" or "leaving" pattern.

8-14. SERIAL-TO-PARALLEL ENCODERS. (Figs. 8-2, 8-8)

8-15. The encoders change the serial stream for each channel from the glitch chip to a pair of 8-bit parallel loads for the RAM.

8-16. Each encoder contains two 8-bit shift registers, which are alternately loaded at the sample clock rate. When a register is full it feeds eight parallel bits to the RAM; then the other register is loaded and unloaded.

8-17. Write pulses for the RAM and clocking pulses for the memory address counters are derived in only one encoder (U22) by dividing the sample clock rate by eight. Thus, acquisition memory need not be especially fast, but can operate at one-sixteenth of 200MHz. The write pulses are out of phase from each other by one-half clock period.

8-18. ACQUISITION RAM. (Figs. 8-3, 8-9)

8-19. Each of the two 8-bit encoder shift registers loads one 256 x 8 RAM (consisting of two 256 x 4 chips) at a time. In each channel, one group of 256 x 8 RAM is desigated "X" memory and the other group of 256 x 8 RAM is designated "Y" memory. A single memory channel, therefore, contains 256 times 8 plus 256 times 8 bits, or 4096 bits.

8-20. Memory is eight channels wide and 4K bits deep in the Wide Sample Mode. In the Fast Sample Mode, however, memory is 8K deep and 4 channels wide, since every second channel in the glitch chip is clocked with the delayed phi2B clock in order to get twice as many clock edges, or sample points, in a time period. Every second encoder is also clocked with the phi2B clock.

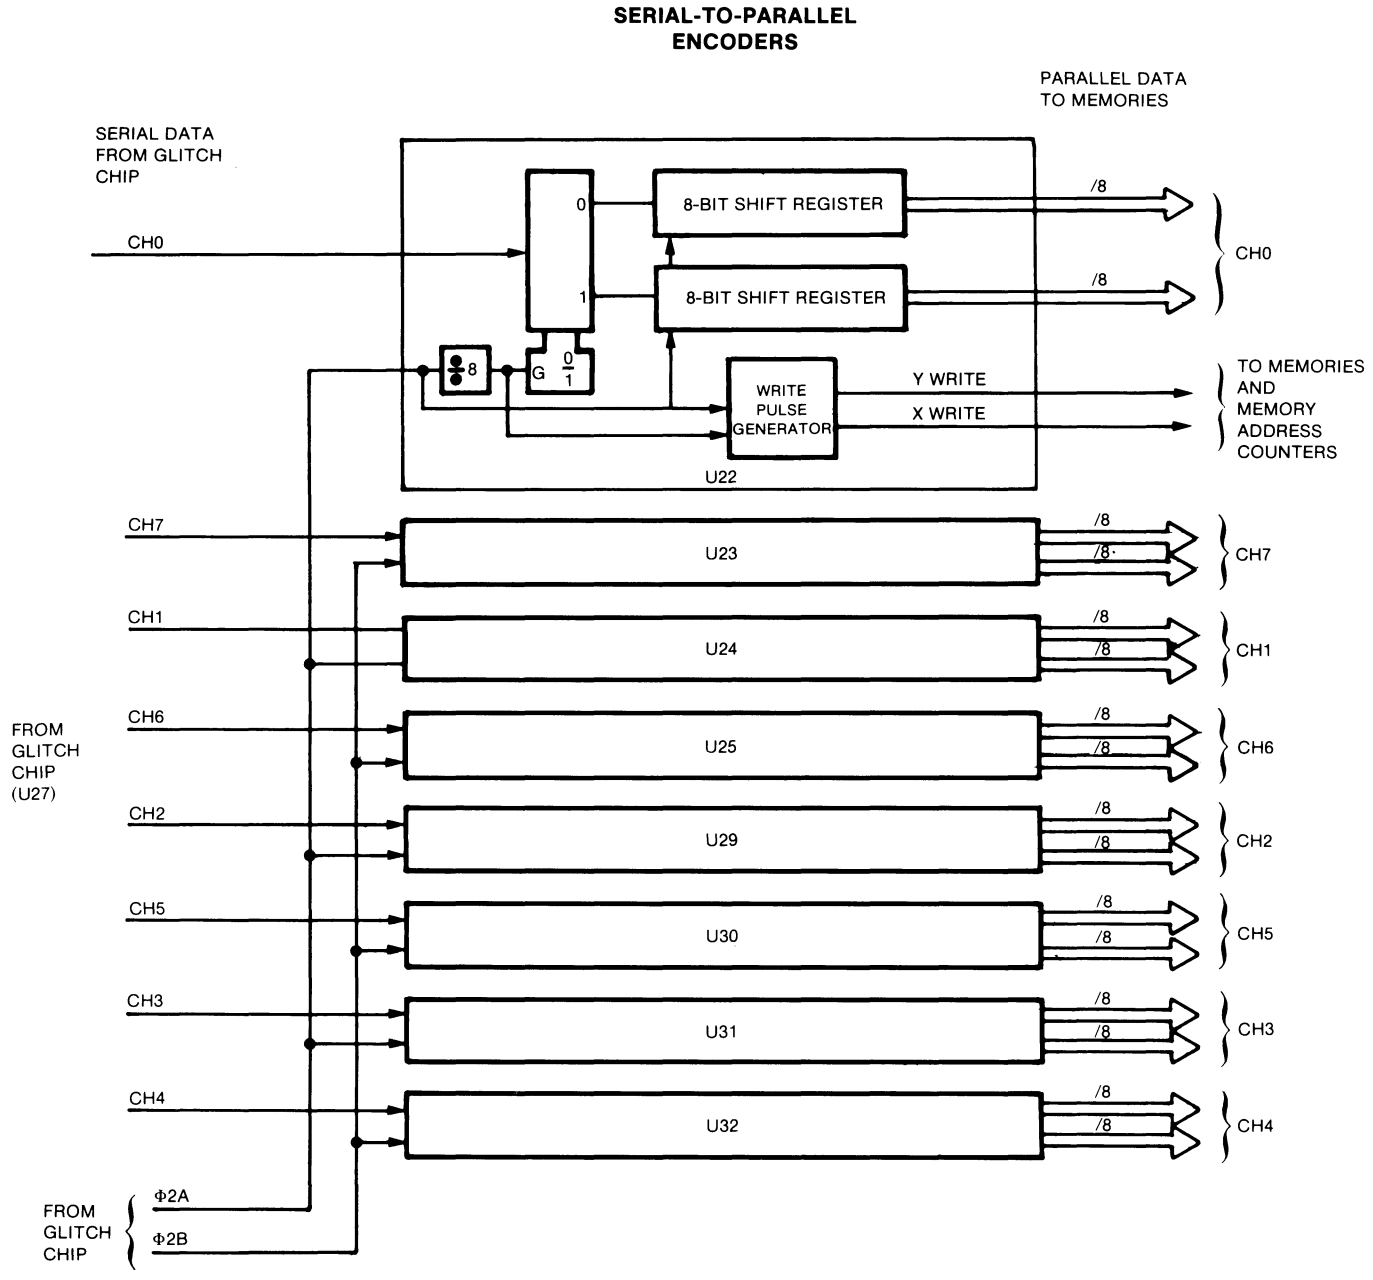


Figure 8-2.
Serial-to-Parallel Encoders
Block Diagram

8-21. MEMORY ADDRESS COUNTERS (MACs). (Fig. 8-6)

8-22. There are two counters, one for "X" memory bank addresses, and one for the "Y" memory bank. After being set to zero before a run by HE/RESET, the MACs are clocked by write pulses (derived from the sample clock and divided by eight) from one of the encoders. Since they are driven by asymmetrical clocks with a fixed phase relationship, the counters differ at most by one count, with the X counter leading.

8-23. A wrap-around latch (U4) which receives the terminal count and the least significant bit of the Y counter, indicates by H/MEMFUL when the memory has been completely filled with new data at least once.

8-24. The window counter on the analyzer Control Board ends the trace a programmed number of sample clocks after tracepoint. Since the trace is ended by stopping the sample clock, the MACs are also stopped. By reading this end-of-trace address, and the three trigger position bits (H/TC0-2) the mainframe CPU can find where tracepoint occurs in memory.

8-25. The "window" programmed into the control board window counter determines trigger position in memory. The "window" is amount of memory between tracepoint and the end-of-acquisition. For example, in our 4K system, if tracepoint occurs at address 3000 (decimal) and the window counter stops acquisition 10 addresses later, then displayed pre-trigger information will begin at address 3011, continue through 4095, and end at 2999. The window, from tracepoint to the end of trace, will be 10 locations; and displayed pre-trigger memory will consist of 4085 locations. (Actually, only 4060, or 8140, bits are displayed).

8-26. The following steps occur in a acquisition run:

a. Before an acquisition run, the MACs and encoders are reset.
b. A run begins and memory fills, with the MACs counting addresses.
c. Tracepoint may or may not occur before the memory is filled once.
d. When tracepoint occurs, the Control Board window counter will count down from a programmed delay, finally stopping acquisition and the MACs.
e. When acquisition is stopped, the CPU will read the last address to which data was written by reading the X address, the least significant Y address bit, and the trigger enable counter on the Control Board.

8-27. DIGITAL/ANALOG CONVERTERS (DACs). (Fig. 8-7)

8-28. The DACs set the middle threshold for the probes in the Wide Sample, Glitch, and Fast Sample Modes. In Dual Threshold Mode, DAC A (U76) sets the lower threshold, using channels 0-3; and DAC B (U78) sets the upper threshold, using channels 4-7.

ACQ 8-8

8-29. LOGIC CONVENTION

8-30. Logic states are defined as follows:

0----------False, negated, inactive, or unasserted state.

1----------True, active, or asserted state.

8-31. Voltage levels representing logic states:

LOW (L)--------The more negative of two voltage levels.

HIGH (H)-------The more positive of two voltage levels.

8-32. Signals may be either high true, or low true, as indicated by the mnemonics on the service sheets.

8-33. The 64602A includes both TTL and ECL ICs. Worst case voltage levels for trouble shooting and signature analysis purposes are as follows: (IC data sheet specifications may be better than this).

TTL Voltage Levels		ECL Voltage Levels	
Level	Voltage	Level	Voltage
LOW	<0.8	LOW	<-1.50
HIGH	>2.0	HIGH	>-1.10

8-34. MNEMONICS.

8-35. Mnemomic definitions are listed in Table 8-1 in the alphabetical order of characters after the slash. The following convention is used:

a. An L or H before the slash indicates active LOW or HIGH.
b. An E after L or H, but before the slash, indicates an ECL signal.
c. No E before the slash indicates a TTL signal.
d. An X instead of L or H means the signal may be programmed as either active LOW or HIGH.
e. The functional mnemonic appears after the slash.

Table 8-1. Mnemonics

MNEMONIC	DEFINITION	SCHEMATICS	ORIGIN
L/A0-15	Address lines from mother-board.	1,2	1
H/BD0	Buffered data-line 0 from mother-board.	1,4	1
HE/CKGHR	Clock to glitch chip holding register.	1,4	1
L/D0-15	Data lines from mother-board.	1,3,5	1
HE/DT	Enable dual-threshold mode.	1,3	1
L/ENDAC	Enable D/A converters.	1,4	1
HE/ENFAST	Enable fast-sample mode.	1,4	1
H/ENTEST	Enable test.	1,4	1

MNEMONIC	DEFINITION	SCHEMATICS	ORIGIN
HE/GHR	Glitch holding register data.	1,4	1
L/IDBD	Identify board, derived from L/ID.	1,3	1
HE/PROBE 0-7 LE/PROBE 0-7	Inputs and inverse inputs from probe.	3,4	3
H/INIT	Initializes encoders. Derived from HE/RESET.	3,4	3
L/LOADCTR	Load counter. Enable loading memory adddress counters.	1,2	1
H/MEMFUL	Memory full. Indicates that memory has been loaded with good data at least once.	2,3	2

Table 8-2. Logic Symbols

GENERAL

All signals flow from left to right, relative to the symbol's orientation with inputs on the left side of the symbol, and outputs on the right side of the symbol (the symbol may be reversed if the dependency notation is a single term.)

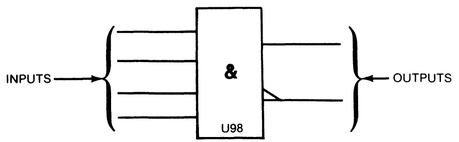
All dependency notation is read from left to right (relative to the symbol's orientation).

An external state is the state of an input or output outside the logic symbol.

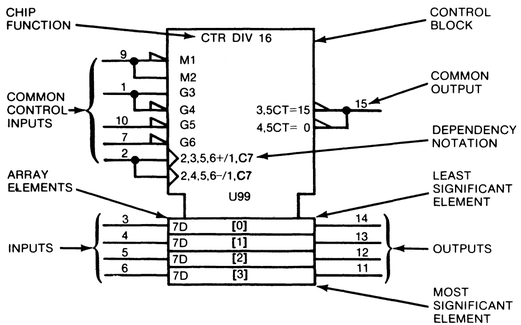
An internal state is the state of an input or output inside the logic symbol. All internal states are True = High.

SYMBOL CONSTRUCTION

Some symbols consist of an outline or combination of outlines together with one or more qualifying symbols, and the representation of input and output lines.



Some have a common Control Block with an array of elements:



CONTROL BLOCK - All inputs and dependency notation affect the array elements directly. Common outputs are located in the control block. (Control blocks may be above or below the array elements.)

ARRAY ELEMENTS -All array elements are controlled by the control block as a function of the dependency notation. Any array element is independent of all other array elements. Unless indicated, the least significant element is always closest to the control block. The array elements are arranged by binary weight. The weights are indicated by powers of 2 (shown in **[ ]**).

LS-08-09-82 - 1

Table 8-2. Logic Symbols (Cont'd)

INPUTS - Inputs are located on the left side of the symbol and are affected by their dependency notation.

Common control inputs are located in the control block and control the inputs/outputs to the array elements according to the dependency notation.

Inputs to the array elements are located with the corresponding array element with the least significant element closest to the control block.

OUTPUTS - Outputs are located on the right side of the symbol and are effected by their dependency notation.

Common control outputs are located in the control block.

Outputs of array elements are located in the corresponding array element with the least significant bit closest to the control block.

CHIP FUNCTION - The labels for chip functions are defined, i.e., CTR - counter, MUX - multiplexer.

DEPENDENCY NOTATION

Dependency notation is always read from left to right relative to the symbol's orientation.

Dependency notation indicates the relationship between inputs, outputs, or inputs and outputs. Signals having a common relationship will have a common number, i.e., C7 and 7D....C7 controls D. Dependency notation 2,3,5,6+/1,C7 is read as when 2 and 3 and 5 and 6 are true, the input will cause the counter to increment by one count....or (/) the input (C7) will control the loading of the input value (7D) into the D flip-flops.

The following types of dependencies are defined:

a. AND (G), OR (V), and Negate (N) denote Boolean relationship between inputs and outputs in any combination.

b. Interconnection (Z) indicates connections inside the symbol.

c. Control (C) identifies a timing input or a clock input of a sequential element and indicates which inputs are controlled by it.

d. Set (S) and Reset (R) specify the internal logic states (outputs) of an RS bistable element when the R or S input stands at its internal 1 state.

e. Enable (EN) identifies an enable input and indicates which inputs and outputs are controlled by it (which outputs can be in their high impedance state).

f. Mode (M) identifies an input that selects the mode of operation of an element and indicates the inputs and outputs depending on that mode.

g. Address (A) identifies the address inputs.

h. Transmission (X) identifies bi-directional inputs and outputs that are connected together when the transmission input is true.

DEPENDENCY NOTATION SYMBOLS

A	Address (selects inputs/outputs) (indicates binary range)	N	Negate (compliments state)
C	Control (permits action)	R	Reset Input
EN	Enable (permits action)	S	Set Input
G	AND (permits action)	V	OR (permits action)
M	Mode (selects action)	Z	Interconnection
		X	Transmission
