

SYSTEM 64 MAINTENANCE FIELD MANUAL

PRELIMINARY RELEASE

MDS QANTEL SYSTEM 64 MAINTENANCE FIELD MANUAL

THIS EDITION WAS CREATED ON 06/03/83

14:20:25:00

**Equipment Characteristics
Installation
Field Service Level Parts Breakdown
AC and DC Interconnection Diagram**

TD-7255

EQUIPMENT CHARACTERISTICS

1.0 GENERAL CHARACTERISTICS

The MDS Qantel System 64 uses a four-board CPU known as the Q64. This processor consists of an ALU board, an Auxiliary board, a Memory Data board, and a Memory Address board.

The System 64 also uses up to four Mem Q64A boards, each of which may hold up to two 512K Mem Q64B modules. The minimum amount of memory is 512K and the maximum amount of memory is 4012K (4.012 megabytes).

The System 64 will support up to 100 video terminals. However, no more than 16 video terminals should be connected to any one IOU 39Q communications controller, or operating efficiency will be degraded.

The basic System 64 uses a Fujitsu 75 megabyte Winchester disc drive and a Cipher 1/2-inch streaming tape drive. The system is designed to handle up to six 75MB, 150MB, or 400MB (Eagle) disc drives in any combination (four drives would be in a separate cabinet). BEST 407-2 is the minimum level operating system that can be used with the System 64.

1.1 SPECIFIC CHARACTERISTICS

1.1.1 Environmental Considerations

Ambient Temperature 50F - 85F (10C - 30C)

Thermal Output 10,750 BTUs per hour (basic system)
18,750 BTUs per hour (with add-on disc cabinet)

Relative Humidity 20% - 80% (during operation, no condensation)
5% - 95% (during storage, no condensation)

Operating Altitude 1000 ft. below - 6000 ft. above sea level
(305 meters below - 1830 meters above sea level)
A hard disc modification is necessary for operation above the upper altitude limit.

Storage Altitude 1000 feet below - 10,000 feet above sea level
(305 meters below - 3050 meters above sea level)

EQUIPMENT CHARACTERISTICS

1.1.2 Electrical Considerations

The A.C. Box may be jumpered for the following voltages:

100vac \pm 10%	200vac \pm 10%
115vac \pm 10%	220vac \pm 10%
127vac \pm 10%	230vac \pm 10%
	240vac \pm 10%

The maximum current drain is as follows:

For 100vac - to 127vac 24 Amps: 3050 VA Max.
For 200vac - to 240vac 12 Amps: 2900 VA Max.

Tolerances for the DC voltages are as follows:

+ and - 12vdc \pm 0.6v
+ 5vdc \pm 0.25v

Maximum available current is as follows:

+12 volts at 1.2 amps -12volts at 1.2 amps
+ 5 volts at 150 amps

INSTALLATION

Power must not be applied to the system during any of the following procedures until Subsection 2.3.

2.0 PWA INSTALLATION CONSIDERATIONS

2.0.1 Auxiliary Board

When the pin patch is set across pins 1 and 2 on Jumper 2 and no pin patch is installed on Jumper 1, the baud rate is 19.2K. This is the normal setting for most local and remote configurations (see Figure 2-1).

When the pin patch is set across pins 2 and 3 on Jumper 2 the baud rate is 300 bits per second. This would only be used for extremely long propagation delays or very slow modems.

2.0.2 MEM Q64A Board

DIP switches 1 and 2 must correspond to the configuration of MEM Q64A boards as they are installed in the system. If there is only one MEM Q64A board, it is board number 0 and DIP switches 1 and 2 should be set to indicate binary 0 (see Figure 2-2). There may be up to 4 MEM Q64A boards in a system-- numbered from 0 to 3-- and DIP switches 1 and 2 on any given board must be set to the binary number corresponding with that board's configured number (switch 2 is the MSB).

A MEM Q64A board must have two MEM Q64B modules attached to it before the next successive MEM Q64A board is installed in the system. Any MEM Q64A board with only one MEM Q64B module, should have the module attached to the bottom half of the A board (i.e. the MEM Q64A boards are to be filled from bottom to top).

Slots 3 - 6 (the slots designated for the System 64 memory) are wired in parallel, but for the sake of uniformity of installation, Board 0 should be installed in Slot 6 and additional boards should be installed sequentially in Slot 5, then Slot 4, and finally Slot 3 as required.

2.0.3 ALU

Notice that all the chips on the ALU board are installed upside down. The PROMS on the ALU are to be installed in the locations shown in Figure 2-3 with the index notches pointing towards the bottom of the ALU board.

INSTALLATION

2.0.4 CARD CAGE MAP

A card cage map is shown in Figure 2-4. The memory and processor boards must be in the correct slots.

2.1 PREPARATION OF THE DISC DRIVE

DO NOT APPLY POWER UNTIL THIS PROCEDURE HAS BEEN PERFORMED ON ALL DISC DRIVES IN THE CABINET.

1. Use a screwdriver to pry up the front panel retainer clips. This will release the top of the front panel (see Figure 2-5). Remove the front panel.
2. Loosen the two screws on each rail locking bracket. Slide the brackets out of the way.
3. Pull the disc drive out as far as it will go.
4. Unlock the spindle, the spindle motor, and the heads (see the Fujitsu section in the Field Service Handbook).
5. Push the disc drive in, replace the rail locking brackets, and replace the front panel.
6. Repeat this procedure for any other disc drives in the cabinet.

2.2 PREPARATION OF THE TAPE DRIVE

1. Pull from underneath the tape drive's front panel while squeezing the handhold on the extreme left side to release the shipping lock. Continue to pull from underneath the front panel to move the tape drive out on its rails.
2. Remove the shipping tape from the front and sides of the tape drive.
3. Lift the top cover, exposing the supply and takeup hubs. There is a plastic brace under the left rear edge of the cover which can be used to prop the cover up.

INSTALLATION

4. Pull back on the spring loaded tachometer arm and remove the plastic foam piece from the takeup hub (see Figure 2-6). Gently set the tachometer arm back on the hub.
5. Loosen the two screws-- one on each side-- located just behind the front panel. the screws are exposed when the top cover of the drive is lifted.
6. Close the top cover and lift up from underneath the front panel until the tape deck is raised as far as it will go. Let the tape deck down slightly and the brace will lock and support the deck. There is plastic dowel which can be inserted into the brace as a safety lock. It hangs from a rubber band near the brace.
7. Remove the foam padding from the logic board. Make sure all edge connectors are firmly in place.
8. Pull the safety dowel out of the brace. Lift up the tape deck and let it down slowly. The brace lock will release.
9. Retighten the two screws and close the top cover.
10. Depress and hold the buttons located in the rails on each side near the rear of the tape drive. Push the drive all the way into the cabinet.

2.3 DC VOLTAGE MEASUREMENT

The D.C. voltage test points listed below are all located on the rear of the backplane.

Logic ground: J125 or J126, pin 21 or pin 23
+12vdc: J125 or J126, pin 5
-12vdc: J125 or J126, pin 27
+5vdc: wide horizontal bus strip across backplane

Check
with
Load

1. The system should be powered off.
2. Unplug all boards from the backplane.
3. Switch off all disc drive power supplies.
4. Turn on the power.

INSTALLATION

5. Measure the +12v, -12v, and the +5v. The +5v should measure approximately 5.05v with no load (from the +5v bus to logic ground). Other voltages should be $\pm 5\%$. Record these measurements.
6. Turn off the power.
7. Switch on all disc drive power supplies.
8. Check switch settings on all controllers, memory, and CPU boards.
9. Install the boards and power up the system.
10. Measure the DC voltages again. The voltages should not vary more than 1/10 volt from the recorded measurements in Step 5. If a severe discrepancy occurs, faulty wiring or a short is indicated.
11. If necessary, adjust the voltages as follows:

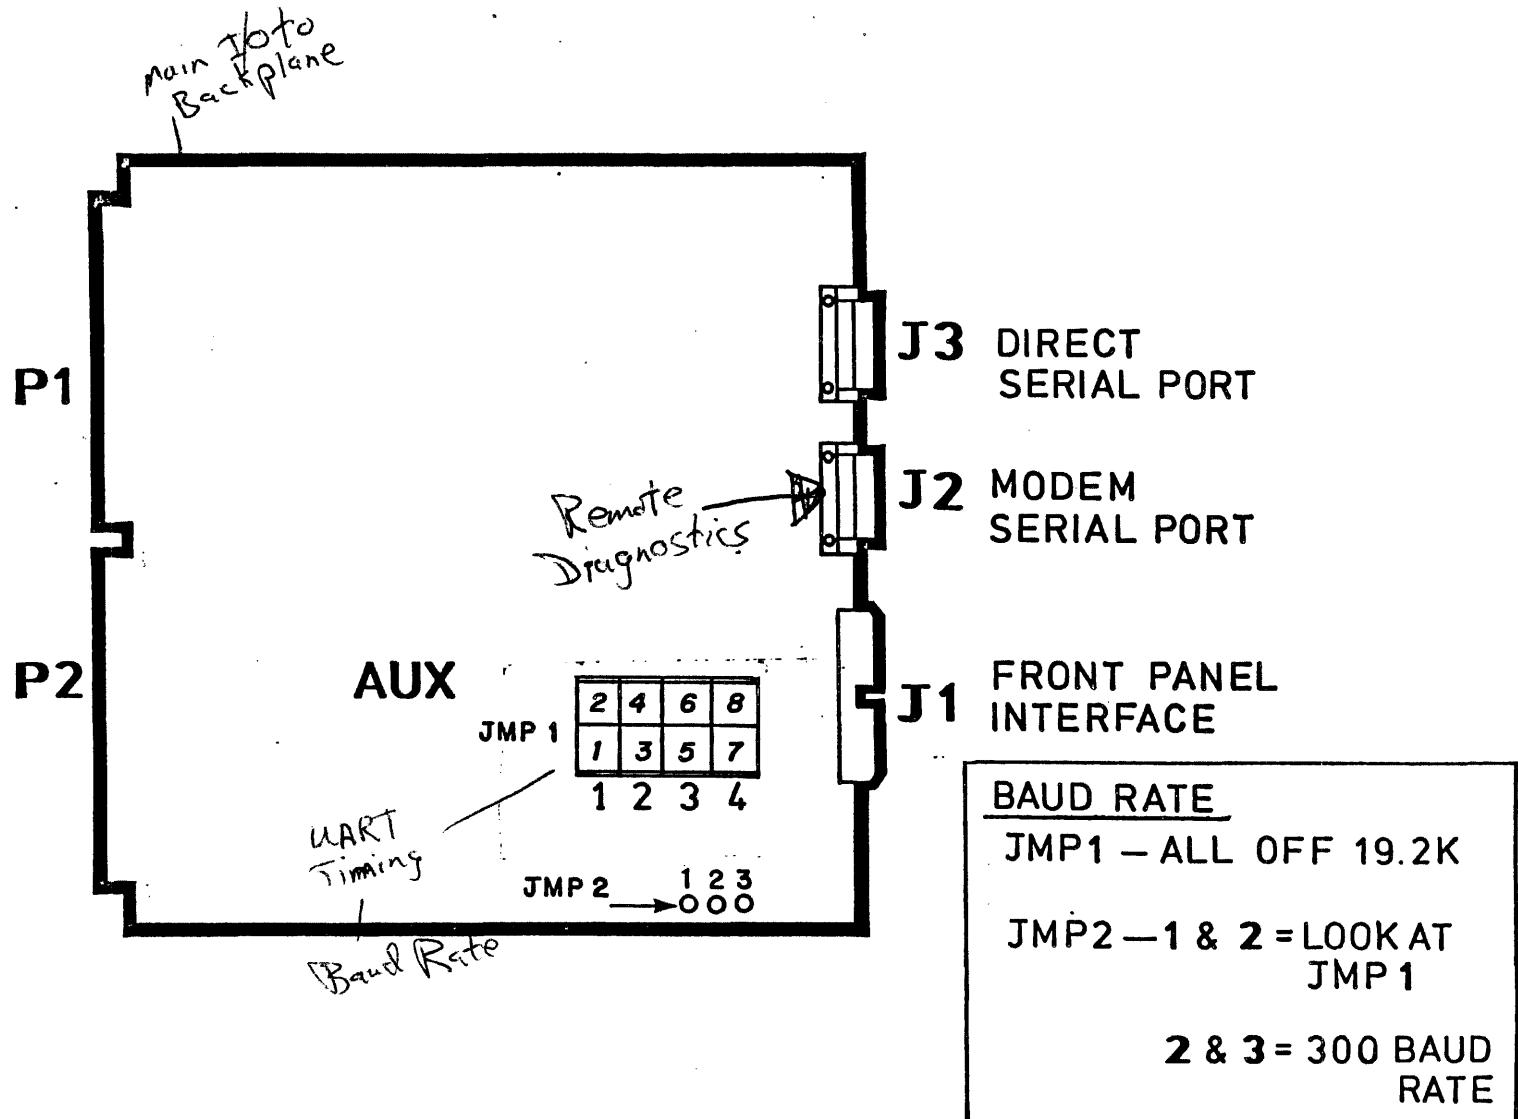

+5v $\pm 0.25\text{v}$
+12v $\pm 0.6\text{v}$
-12v $\pm 0.6\text{v}$

2.4 TEST PANEL

The test panel is mounted immediately under the control panel. To access the test panel, remove the two screws that hold the plastic cover over the test panel (see Figure 2-7). The test panel is for diagnostic purposes and is protected from user access by the plastic cover.

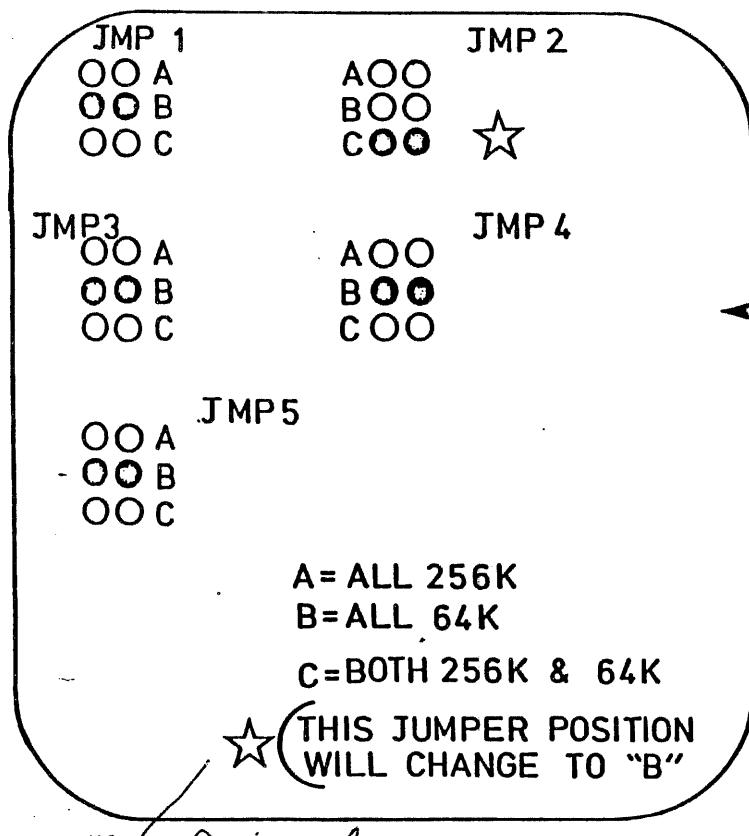

2.5 INTERCONNECTION DIAGRAM

An interconnection diagram is included with this document in case any peripheral devices need to be replaced or removed and reinstalled. The A.C. box is also detailed in the interconnection diagram.

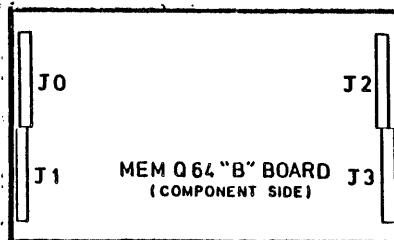

The switch settings for JMP1 are shown below:

BAUD RATE	CONNECTED SWITCHES
19200	None
9600	1-2
7200	3-4
4800	1-2 3-4
3600	5-6
2400	1-2 5-6
2000	3-4 5-6
1800	1-2 3-4 5-6
1200	7-8
600	1-2 7-8
300	3-4 7-8
150	1-2 3-4 7-8
134.50	5-6 7-8
110	1-2 5-6 7-8
75	3-4 5-6 7-8
50	1-2 3-4 5-6 7-8

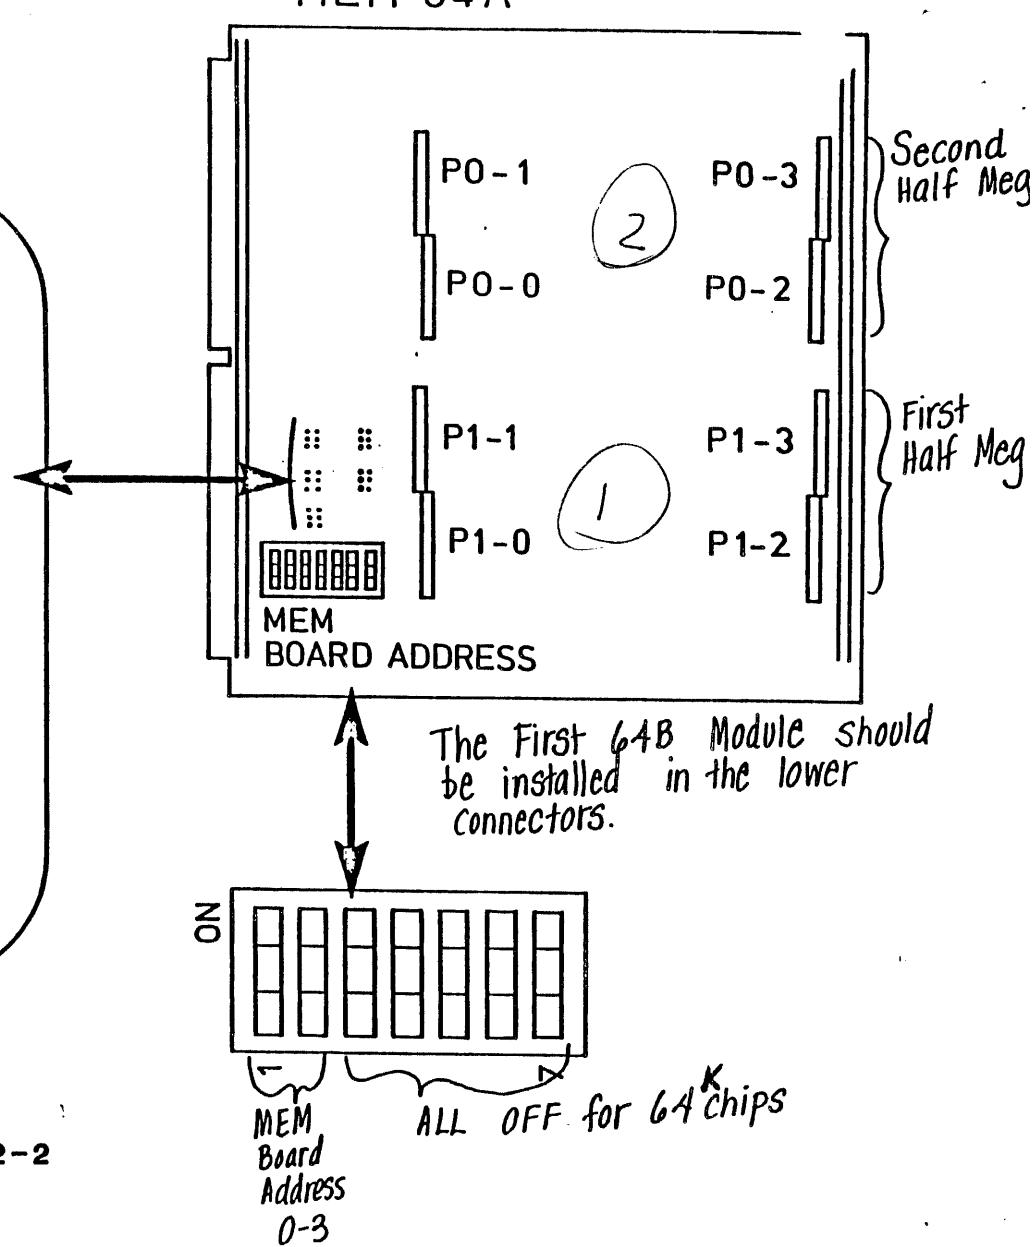

Mem R board

Notes
Printed X

Figure 2-2

Q64 MEMORY MAP

Board 0 \$000000 - \$07FFFF = 512 KB / 64B
 \$080000 - \$0FFFFFF = 1.0 MB

Board 1 \$100000 - \$17FFFF = 1.5 MB
 \$180000 - \$1FFFFFF = 2.0 MB

Board 2 \$200000 - \$27FFFF = 2.5 MB
 \$280000 - \$2FFFFFF = 3.0 MB

Board 3 \$300000 - \$37FFFF = 3.5 MB
 \$380000 - \$3FFFFFF = 4.0 MB

Brd.3		On

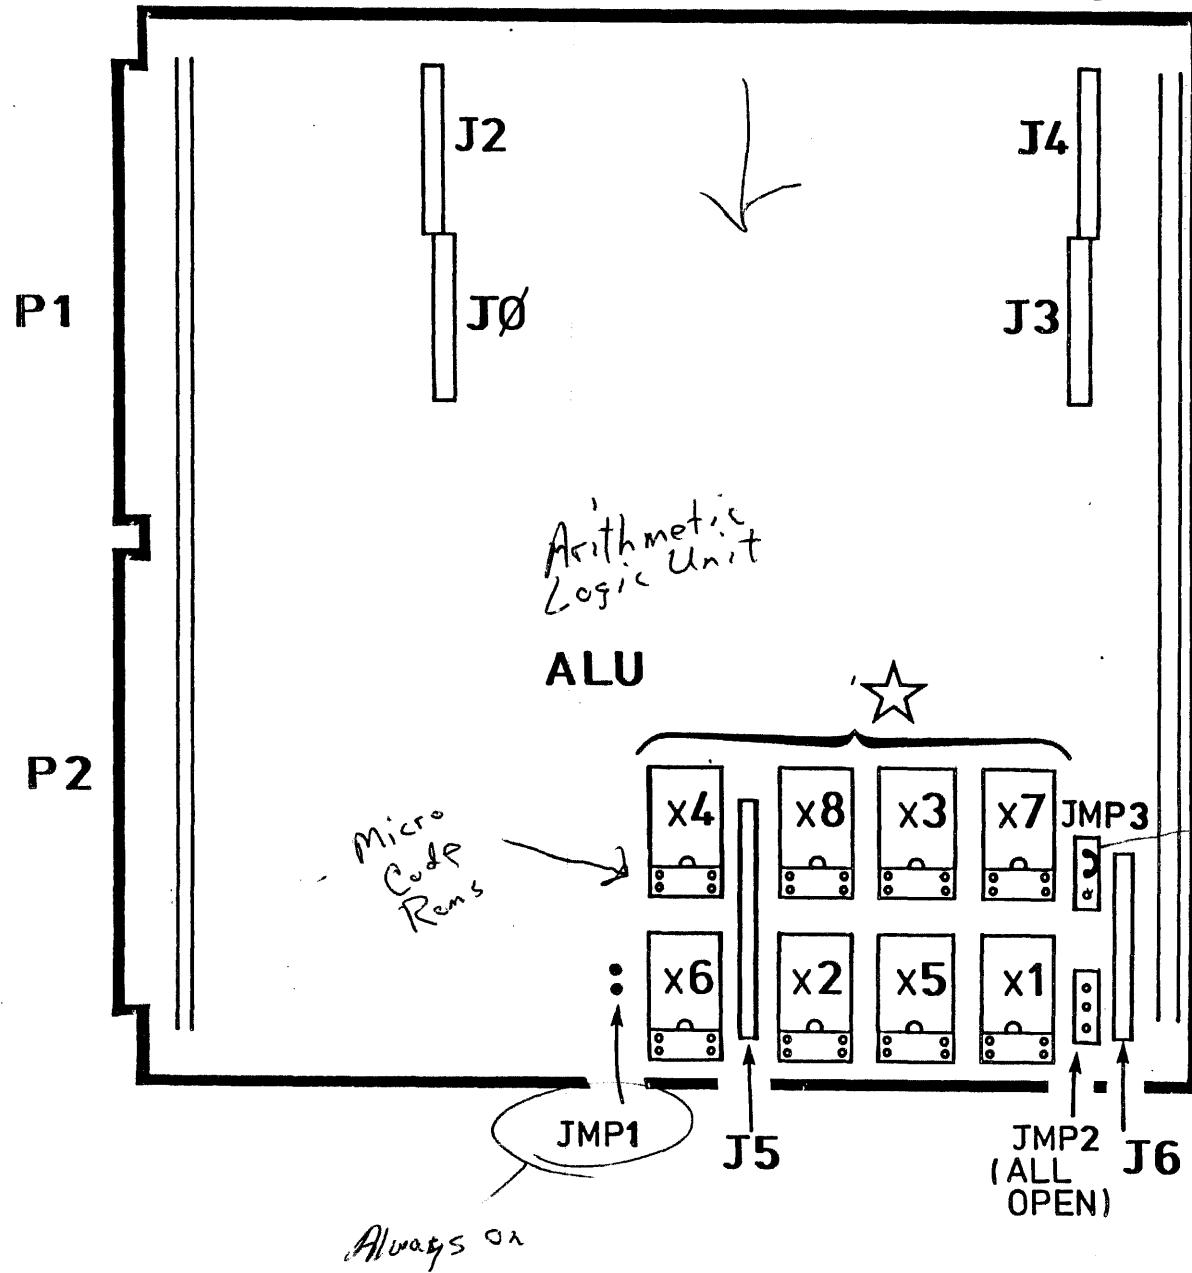

Pin Patches

Currently can only be set one way. All patches ON the pins provided. In the future, new pins will be added. Patches will then be changed to define the memory chip size to the MEM64A.

All patches set to "A" = 256K RAMs
All patches set to "B" = 64K RAMs
All patches set to "C" = Mixed

* Patches set to "C" will require setting SW3-SW8 to define the mix. The switch settings are not defined yet.

NOTE: UNLESS OTHERWISE SPECIFIED
1. PHANTOM LINES INDICATE OPTIONAL VERSIONS.

2. P/O DENOTES "PART OF".

3. SEE TABLE NO. 1.

4. 115V VERSION SHOWN REFER TO TABLE 2 FOR OTHER VOLTAGES.

5. GROUND TERMINALS E3-E6 ARE LOCATED IN THE W3 AC BOX ASSY.

6. CABLES TO DISK P.S. ARE FURNISHED WITH DISC UNIT.
